Rourke Baby Record: RESOURCES 1: General (July, 2011)

- Important: Corrected age should be used at least until 24 to 36 months of age for premature infants born at <37 wks gestation.
- Measuring growth The growth of all term infants, both breastfed and non breastfed, and preschoolers should be evaluated using Canadian growth charts from the 2006 World Health Organization Child Growth Standards (birth to 5 years) with measurement of recumbent length (birth to 2-3 years) or standing height (\geq 2 years), weight, and head circumference (birth to 2 years). www.cps.ca/english/publications/CPS10-01.htm www.dietitians.ca/growthcharts

NUTRITION - www.hc-sc.gc.ca/fn-an/pubs/infant-nourrisson/nut infant nourrisson term e.html - www.osnpph.on.ca/resources/index.php

- Colic www.cps.ca/english/statements/N/InfantileColic.htm
- Breastfeeding: Exclusive breastfeeding is recommended for the first six months of life for healthy term infants. Breast milk is the optimal food for infants, and breastfeeding (with complementary foods) may continue for up to two years and beyond unless contraindicated. Breastfeeding reduces gastrointestinal and respiratory infections. Maternal support (both antepartum and postpartum) increases breastfeeding and prolongs its duration. Early and frequent mother-infant contact, rooming in, and banning handouts of free infant formula increase breastfeeding rates.
- Breastfeeding www.cps.ca/english/statements/N/BreastfeedingMar05.htm
- Ankyloglossia and breastfeeding www.cps.ca/english/statements/CP/cp11-01.htm
- Maternal medications when breastfeeding toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?LACT
- Motherisk www.motherisk.org
- Weaning www.cps.ca/english/statements/CP/cp04-01.htm
- Routine Vitamin D supplementation of 400 IU/day (800 IU/day in northern communities) is recommended for all breastfed infants until the diet provides a sufficient source of Vitamin D \sim 1 year of age). Formula may only supply a portion of the recommended daily vitamin D intake if less than 1000 mL (33 oz) is consumed daily. Breastfeeding mothers should continue to take Vitamin D supplements for the duration of breastfeeding. www.cps.ca/english/statements/ii/fnim07-01.htm
- Infant formula formula composition and algorithm re use www.albertahealthservices.ca/3505.asp
- · Milk consumption range is consensus only & is provided as an approximate guide.
- Soy-based formula is not recommended for routine use in term infants as an equivalent alternative to cow's milk formula, or for cow milk protein allergy, and is contraindicated for preterm infants. www.cps.ca/english/statements/N/InfantSoyConcern.htm
- Transition to lower fat diet: A gradual transition from the high-fat infant diet to a lower-fat diet begins after age 2 years as per Canada's Food Guide.
- Encourage a healthy diet as per Canada's Food Guide
 - www.hc-sc.gc.ca/fn-an/food-guide-aliment/index_e.html
- Vegetarian diets www.cps.ca/english/statements/CP/cp10-02.htm
- Mercury in fish www.hc-sc.gc.ca/fn-an/securit/chem-chim/environ/mercur/index-eng.php

INJURY PREVENTION: In Canada, unintentional injuries are the leading cause of death in children and youth. Most of these preventable injuries are caused by motor vehicle collisions, drowning, choking, burns, poisoning, and falls. For more safety information: www.safekidscanada.ca www.cps.ca/english/publications/InjuryPrevention.htm

• Transportation in motor vehicles: www.cps.ca/english/statements/IP/IP08-01.htm Children < 13 years should sit in the rear seat. Keep children away from all airbags. Install and follow size recommendations as per specific car seat model and keep child in each stage as long as possible.

Use rear-facing infant seat until at least 1 year of age AND 10 kg (22 lb).

Use forward-facing child seat after 1 year of age AND 10 - 22 kg (22 - 48 lb) and up to 122 cm (48"). Maximum ht/wt may vary with car seat model.

Use booster seat from at least 18 - 36 kg (40 - 80 lb) and up to 145 cm (4'9"). Use lap and shoulder belt in the rear seat for children over 8 yrs who are at least 36 kg (80 lb) and 145 cm (4'9") and fit vehicle restraint system.

- Bicycle: wear bike helmets. Replace if heavy impact or sign of damage.
- Drowning: www.cps.ca/english/statements/IP/IP03-01.htm
- Bath safety: Never leave a young child alone in the bath. Do not use infant bath rings or bath seats.
- Water safety: Recommend adult supervision, training for adults, 4-sided pool fencing, lifejackets, swimming lessons, and boating safety to decrease the risk of drowning.
- Choking: Avoid hard, small and round, smooth and sticky solid foods until age 3 years. Use safe toys, follow minimum age recommendations, and remove loose parts and broken toys.
- · Burns: Install smoke detectors in the home on every level.
- Keep hot water at a temperature < 49°C.
- Poisons: Keep medicines and cleaners locked up and out of child's reach. Have Poison Control $Centre\ number\ handy.\ \textit{Use\ of\ ipecac\ is\ contraindicated\ in\ children.}$
- Falls: Assess home for hazards- never leave baby alone on change table or other high surface; use window guards and stair gates. Baby walkers are banned in Canada and should never be used. Advise against trampoline use at home. www.cps.ca/english/statements/IP/IP07-01.htm
- Safe sleeping environment: www.cps.ca/english/statements/CP/cp04-02.htm
- Sleep position and SIDS/Positional plagiocephaly: Healthy infants should be positioned on their backs for sleep. Their heads should be placed in different positions on alternate days. Sleep positioners should not be used. While awake, infants should have supervised tummy time. Counsel parents on the dangers of other contributory causes of SIDS such as overheating, maternal smoking or second-hand smoke.
- Bed sharing: Advise against bed sharing which is associated with an increased risk for SIDS.
- Crib safety/Room sharing: Encourage putting infant in a crib, cradle or bassinette, that meets current Canadian regulations (www.hc-sc.gc.ca/ahc-asc/media/nr-cp/_2010/2010_212-eng.php) in parents' room for the first 6 months of life. Room sharing is protective against SIDS.
- Firearm safety/removal: There is evidence-based association between a firearm in the home and increased risk of unintentional firearm injury, suicide, or homicide. www.cps.ca/english/statements/AM/AH05-02.htm

INVESTIGATIONS/SCREENING

Anemia screening: All infants from high-risk groups for iron deficiency anemia require screening between 6 and 12 months of age, e.g. Lower SES; Asian; First Nations children; low-birth-weight and premature infants, and infants fed whole cow's milk during their first year of life.

Hemoglobinopathy screening: Screen all neonates from high-risk groups: Asian, African & Mediterranean. Universal newborn hearing screening (UNHS) effectively identifies infants with congenital hearing loss & allows for early intervention & improved outcomes. www.cps.ca/english/statements/CP/cp11-02.htm

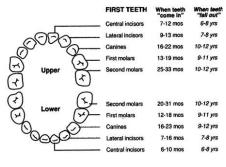

- Second-hand smoke exposure: contributes to childhood illnesses such as URTI, middle ear effusion, persistent cough, pneumonia, asthma, and SIDS.
- Advise parents against using OTC cough/cold medications.
- http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php
- · Complementary and alternative medicine (CAM): Questions should be routinely asked on the use of homeopathy and other complementary and alternative medicine therapy or products, especially for children with chronic conditions.
- www.cps.ca/english/statements/DT/DT05-01.htm
- Homeopathy www.cps.ca/english/statements/CP/cp05-01.htm
- Pacifier use may decrease risk of SIDS and should not be discouraged in the 1st year of life after breastfeeding is well established, but should be restricted in children with chronic/recurrent otitis media. - www.cps.ca/english/statements/CP/cp03-01.htm
- Fever advice/thermometers: Fever ≥ 38°C in an infant < 3 months needs urgent evaluation. Ibuprofen and acetaminophen are both effective antipyretics. Acetaminophen remains the first choice for antipyresis under 6 months of age; thereafter ibuprofen or acetaminophen may be used. Alternating acetaminophen with ibuprofen for fever control is not recommended in primary care settings as this may encourage fever phobia, and the potential risks of medication error outweigh measurable clinical benefit. - www.cps.ca/english/statements/CP/cp00-01.htm
- Footwear: Shoes are for protection, not correction. Walking barefoot develops good toe gripping and muscular strength - http://www.cps.ca/english/statements/CP/FootwearChildren.htm
- · Healthy Active Living: Encourage increased physical activity and decreased sedentary pastimes with parents as role models.
- www.cps.ca/english/statements/HAL/HAL02-01.htm
- Media use www.cps.ca/english/statements/CP/pp03-01.htm
- · Sun exposure/sunscreens/insect repellents: Minimize sun exposure. Wear protective clothing, hats, properly applied sunscreen with SPF ≥ 30 for those > 6 months of age. No DEET in < 6months; 6-24 months 10% DEET apply max once daily; 2 - 12 yrs 10% DEET apply max TID.
- Pesticides: Avoid pesticide exposure. Encourage pesticide-free foods.
- www.ocfp.on.ca/docs/public-policy-documents/pesticides-literature-review.pdf
- Lead Screening (www.cfp.ca/cgi/reprint/56/6/531) is recommended for children who:
- in the last 6 months lived in a house or apartment built before 1978:
- live in a home with recent or ongoing renovations or peeling or chipped paint;
- have a sibling, housemate, or playmate with a prior history of lead poisoning;
- live near point sources of lead contamination;
- have household members with lead-related occupations or hobbies;
- are refugees aged 6 mo 6 yrs, within 3 months of arrival and again in 3-6 months.

Even for blood levels less than 10ug/dL, evidence suggests an association, and perhaps partial causal relationship with lower cognitive function in children. www.pulsus.com/journals/abstract.js p?sCurrPg=abstract&jnlKy=5&atlKy=3087&isuKy=444&isArt=t&fromfold=

- Websites about environmental issues:
- CPCHE www.healthvenvironmentforkids.ca/
- AAP www.aap.org/healthtopics/environmentalhealth.cfm

Dental Care:

• Dental Cleaning: As excessive swallowing of toothpaste by young children may result in dental fluorosis, children 3-6 years of age should be supervised during brushing and only use a small amount (e.g. pea-sized portion) of fluoridated toothpaste twice daily. Children under 3 years of age should have their teeth and gums brushed twice daily by an adult using either water (if low risk for tooth decay) or a rice grain sized portion of fluoridated toothpaste (if

- Fluoride supplements are not recommended before eruption of the first permanent tooth (~6 - 8 years) unless the child is at high risk for dental caries. www.cda-adc.ca/ files/position statements/Fluorides-English-2010-06-08.pdf
- To prevent early childhood caries: avoid sweetened juices/liquids and constant sipping of milk or natural juices in both bottle and cup.

PHYSICAL EXAMINATION

- Vision inquiry/screening: www.cps.ca/english/statements/cp/cp09-02.htm
- Check Red Reflex for serious ocular diseases such as retinoblastoma and cataracts.
- Corneal light reflex/cover-uncover test & inquiry for strabismus: With the child focusing on a light source, the light reflex on the cornea should be symmetrical. Each eye is then covered in turn, for 2 – 3 seconds, and then quickly uncovered. The test is abnormal if the uncovered eye "wanders" OR if the covered eye moves when uncovered.
- Hearing inquiry/screening Any parental concerns about hearing acuity or language delay should prompt a rapid referral for hearing assessment. Formal audiology testing should be performed in all high-risk infants, including those with normal UNHS. Older children should be screened if clinically indicated.
- Fontanelles The posterior fontanelle is usually closed by 2 months and the anterior by 18 months.
- Muscle tone Physical assessment for spasticity, rigidity, and hypotonia should be performed.
- · Hips There is insufficient evidence to recommend routine screening for developmental dysplasia of the hips, but examination of the hips should be included until at least one year, or until the child can walk. http://pediatrics.aappublications.org/cgi/reprint/117/3/898
- Snoring in the presence of sleep-disordered breathing warrants assessment re obstructive sleep apnea. http://aappolicy.aappublications.org/cgi/reprint/pediatrics;109/4/704.pdf

www.rourkebabyrecord.ca Resource Resources 2: Healthy Child Development (July, 2011)

DEVELOPMENT

Maneuvers are based on the Nipissing District Development Screen™ (www.ndds.ca) and other developmental literature. They are not a developmental screen, but rather an aid to developmental surveillance. They are set after the time of normal milestone acquisition. Thus, absence of any one or more items is considered a high-risk marker and indicates consideration for further developmental assessment, as does parental or caregiver concern about development at any stage.

REHAVIOUR

Crying: Excessive crying may be caused by behavioral or physical factors or be the upper limit of the normal spectrum. Evaluation of these etiological factors and of the burden for parents is essential and raises awareness of the potential for the shaken baby syndrome.

<u>Shaken baby syndrome:</u> www.cps.ca/english/statements/PP/cps01-01.htm www.dontshake.org Night waking: occurs in 20% of infants and toddlers who do not require night feeding. Counselling around positive bedtime routines (including training the child to fall asleep alone), removing nighttime positive reinforcers, keeping morning awakening time consistent, and rewarding good sleep behaviour has been shown to reduce the prevalence of night waking, especially when this counselling begins in the first 3 weeks of life.

- www.mja.com.au/public/issues/182 05 070305/sym10800 fm.html

Swaddling: Proper swaddling of the infant for the first 6 months of life may promote longer sleep periods but could be associated with adverse events (hyperthermia, SIDS, or development of hip dysplasia) if misapplied. A swaddled infant must always be placed supine with free movement of hips and legs, and the head uncovered.

Inform parents that warm, responsive, flexible & consistent discipline techniques are assoc with positive child outcomes. Over reactive, inconsistent, cold & coercive techniques are assoc with negative child outcomes.

- www.ocfp.on.ca/docs/research-projects/improving-the-odds-healthy-child-development-manual-2010-6th-edition.pdf (section 3)

Refer parents of children at risk of, or showing signs of, behavioral or conduct problems to structured parenting programs which have been shown to increase positive parenting, improve child compliance, and reduce general behavior problems. Access community resources to determine the most appropriate and available research-structured programs.

(eg. The Incredible Years, Right from the Start, COPE program). http://www.child-encyclopedia.com/en-ca/parenting-skills/how-important-is-it.html

Encourage parents to read to their children within the first few months of life and to limit TV, video and computer games to provide more opportunities for reading.

PARENTAL/FAMILY ISSUES - HIGH RISK INFANTS/CHILDREN

- Maternal depression Physicians should have a high awareness of maternal depression, which is a risk factor for the socio-emotional and cognitive development of children. Although less studied, paternal factors may compound the maternal-infant issues.
- www.cps.ca/english/statements/PP/pp04-03.htm
- Fetal alcohol spectrum disorder (FASD) www.cps.ca/english/statements/II/ii02-01.htm
- Foster care Children entering foster care are a high risk population requiring special needs for health supervision. www.cps.ca/english/statements/cp/cp08-01.htm
- Assess home visit need: There is good evidence for home visiting by nurses during the perinatal period through infancy for first-time mothers of low socioeconomic status, single parents or teenaged parents to prevent physical abuse and/or neglect.
- www.cmaj.ca/cgi/content/full/163/11/1451
- Risk factors for physical abuse: low SES; young maternal age (<19 years); single parent family; parental experiences of own physical abuse in childhood; spousal violence; lack of social support; unplanned pregnancy or negative parental attitude towards pregnancy.
- Risk factors for sexual abuse: living in a family without a natural parent; growing up in a family with poor marital relations between parents; presence of a stepfather; poor child-parent relationships; unhappy family life.

NONPARENTAL CHILD CARE

Inquire about current child care arrangements. High quality child care is associated with improved paediatric outcomes in all children.

Factors enhancing quality child care include: practitioner general education and specific training; group size and child/staff ratio; licensing and registration/accreditation; infection control and injury prevention; and emergency procedures.

- www.cps.ca/english/statements/CP/cp2009-01.htm
- Well Beings: www.caringforkids.cps.ca/wellbeings/index.htm

AUTISM SPECTRUM DISORDER

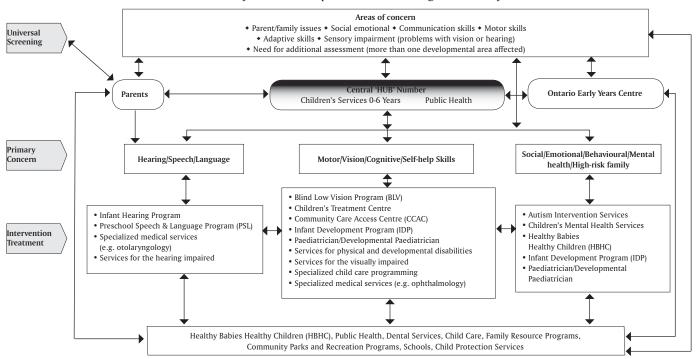

Specific screening for ASD at 18 - 24 months using the M-CHAT should be performed on all children with any of the following: failed items on the social/emotional/communication skills inquiry, sibling with autism, or developmental concern by parent, caregiver, or physician. If the M-CHAT is abnormal, use the M-CHAT Follow-up Interview to reduce the false positive rate and avoid unnecessary referrals and parental concern. The M-CHAT tool and follow-up interview are found at: www.mchatscreen.com

TOILET LEARNING

The process of toilet learning has changed significantly over the years and within different cultures. In Western culture, a child-centred approach, where the timing and methodology of toilet learning is individualized as much as possible, is recommended.

Vaccine literacy - www.cps.ca/english/statements/ID/VaccineLiteracy.pdf

- AAP recommendation http://aapredbook.aappublications.org/resources/2009_0-6yrs_Schedule_FINAL.pdf
- Immunization pain reduction strategies: During vaccination, pain reduction strategies with good evidence include breastfeeding or use of sweet-tasting solutions, use of the least painful vaccine brand, and consideration of topical anaesthetics.

 www.cmaj.ca/cgi/reprint/182/18/E843?maxtoshow=&hits=10&RESULTFORMAT=&fulltext=Immunization&searchid=1&FIRSTINDEX=0&volume=182&issue=18&resourcetype=HWCIT

VACCINE NOTES (Adapted from NACI website: July 29, 2011)

- Diphtheria, Tetanus, acellular Pertussis and inactivated Polio virus vaccine (DTaP-IPV): DTaP-IPV vaccine is the preferred vaccine for all doses in the vaccination series, including completion of the series in children < 7 years who have received ≥ 1 dose of DPT (whole cell) vaccine (e.g., recent immigrants).
- Haemophilus influenzae type b conjugate vaccine (Hib): Hib schedule shown is for the Haemophilus b capsular polysaccharide PRP conjugated to tetanus toxoid (Act-HIBTM) or the Haemophilus b oligosaccharide conjugate HbOC (HibTITERTM) vaccines. This vaccine may be combined with DTaP in a single injection.
- Measles, Mumps and Rubella vaccine (MMR): A second dose of MMR is recommended, at least 1 month after the first dose for the purpose of better measles protection. For convenience, options include giving it with the next scheduled vaccination at 18 months of age or at school entry (4-6 years) (depending on the provincial/territorial policy), or at any intervening age that is practical. The need for a second dose of mumps and rubella vaccine is not established but may benefit (given for convenience as MMR). The second dose of MMR should be given at the same visit as DTaP-IPV (± Hib) to ensure high uptake rates. MMR and varicella vaccines should be administered concurrently (at different sites if the MMRV [combined MMR/varicella] is not available) or separated by at least 4 weeks.
- Varicella vaccine: Children aged 12 months to 12 years who have not had varicella should receive 2 doses of varicella vaccine (univalent varicella or MMRV). Unvaccinated individuals ≥ 13 years who have not had varicella should receive two doses at least 28 days apart (univalent varicella only). Consult NACI guidelines for recommended options for catch-up varicella vaccination. Varicella and MMR vaccines should be administered concurrently (at different sites if the MMRV [combined MMR/varicella] vaccine is not available) or separated by at least 4 weeks.
- Hepatitis B vaccine (Hep B): Hepatitis B vaccine can be routinely given to infants or preadolescents, depending on the provincial/territorial policy. The first dose can be given at 2 months of age to fit more conveniently with other routine infant immunization visits. The second dose should be administered at least 1 month after the first dose, and the third at least 2 months after the second dose, but again may fit more conveniently into the 4- and 6-month immunization visits. A two-dose schedule for adolescents is an option. For infants born to chronic carrier mothers, the first dose should be given at birth (with Hepatitis B immune globulin). (See also SELECTED INFECTIOUS DISEASES RECOMMENDATIONS below.)
- Pneumococcal conjugate vaccine 13-valent (Pneu-Conj): Recommended schedule, number of doses and subsequent use of 23 valent polysaccharide pneumococcal vaccine depend on the age of the child, previous administration of -7 or-10 valent vaccine, if at high risk for pneumococcal disease, and when vaccination is begun. Consult NACI guidelines for maximizing coverage up to 59 months of age.
- Meningococcal conjugate vaccine (Men-C): www.cps.ca/english/statements/ID/ID09-02.htm Monovalent vaccine to Type C (Men-C-C) is indicated for all ages, and quadravalent to Types A/C/W/Y (Men-C-ACWY) for age 2 yrs and over. Recommended vaccine, schedule and number of doses of meningococcal vaccine depend on the age of the child and vary between provinces/territories. Possible schedules include:
 - Men-C-C: 2 3 doses under 12 mos of age AND booster dose between 12 24 mos age.

 OR

- Men-C-C: 1 dose at 12 mos of age.

Men-C-C or Men-C-ACWY booster dose should also be given at 12 yrs of age or during adolescence.

- Diphtheria, Tetanus, acellular Pertussis vaccine adult/adolescent formulation (dTap): a combined adsorbed "adult type" preparation for use in people ≥ 7 years of age, contains less diphtheria toxoid and pertussis antigens than preparations given to younger children and is less likely to cause reactions in older people. This vaccine should be used in individuals > 7 years receiving their primary series of vaccines.
- Influenza vaccine: Recommended for all children between 6 and 23 months of age, and for older high-risk children. Previously unvaccinated children up to 9 years of age require 2 doses with an interval of at least 4 weeks. The second dose is not required if the child has received one or more doses of influenza vaccine during the previous immunization season.
- Rotavirus vaccine: Universal rotavirus vaccine is recommended by NACI and CPS. Two oral vaccines are currently authorized for use in Canada: Rotarix (2 doses) and RotaTeq (3 doses). Dose #1 is given between 6 wks and 14 wks/6 days with a minimum interval of 4 weeks between doses. Maximum age for the last dose is 8 mos/0 days. www.cps.ca/english/statements/ID/ID10-01.htm
 www.phac-aspc.gc.ca/publicat/ccdr-rmtc/10vol36/acs-4/index-eng.php www.cps.ca/English/statements/ID/ID10-01.htm

SELECTED INFECTIOUS DISEASES RECOMMENDATIONS

See CPS position statements of the Infectious Diseases and Immunization Committee: www.cps.ca/english/publications/InfectiousDiseases.htm

• Hepatitis B immune globulin and immunization:

Infants with HBsAg-positive parents or siblings require Hepatitis B vaccine at birth, at 1 month, and 6 months of age.

Infants of HBsAg-positive mothers also require Hepatitis B immune globulin at birth and follow-up immune status at 9 – 12 months for HBV antibodies and HBsAg.

Hepatitis B vaccine should also be given to all infants from high-risk groups, such as:

- infants where at least one parent has emigrated from a country where Hepatitis B is endemic;
- infants of mothers positive for Hepatitis C virus;
- infants of substance-abusing mothers.
- Human Immunodeficiency Virus type 1 (HIV-1) maternal infections:

Breastfeeding is contraindicated for an HIV-1 infected mother even if she is receiving antiretroviral therapy.

• Hepatitis A or A/B combined (when Hepatitis B vaccine has not been previously given):

These vaccines should be considered when traveling to countries where Hepatitis A or B are endemic.

• Tuberculosis - TB skin testing:

TB skin testing should be done if the infant is living with anyone being investigated or treated for TB. TB skin testing should also be considered in high-risk groups, including Aboriginal people, immigrants and long-term travellers from areas with a high prevalence of TB.
