ASOS Product Improvement Implementation Plan

[Addendum I]

For

ASOS Processor Board Upgrade

February 14, 2002

(Revision # 1: 02/05/03)

U.S. DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
National Weather Service/Office of Operational Systems
Field Systems Operations Center/Observing Systems Branch

TABLE OF CONTENTS

Executive Summary

With the completion of the full deployment of the Automated Surface Observing System (ASOS) at *almost 1,000 National Weather Service (NWS), Federal Aviation Administration (FAA), and Department Of Defense (DOD)* locations nationwide, a new phase of Planned Product Improvement (PPI) has begun. These planned improvements will bring even greater observing capability, processing and communications capacity, and reporting accuracy and consistency to the ASOS. The planned improvements for the ASOS include:

Processor Board Replacement,
Dew Point Sensor Replacement,
All-Weather Precipitation Accumulation Gauge,
Ice Free Wind sensor,
Enhanced Precipitation Identification sensor,
Ceilometer replacement, and
Software Enhancements

A series of implementation plans are needed for these improvements. This document describes the step-by-step process and the factors which impact on the operational implementation of the new ASOS Processor Board at 884 NWS and FAA sponsored ASOS locations nationwide. This includes 313 NWS sponsored locations and 571 FAA sponsored locations. *The 109 ASOS locations sponsored by DOD are not included in this implementation plan*. Other documents in this series will describe the implementation process for the other components. Each document describes what will be done to successfully bring the improvement to an operational status.

Because of the enhanced reliability of the new Processor Board, all FAA locations and 286 of the 313 NWS locations can be configured with a single Processor Board. The remaining 27 NWS locations, known as Single Cabinet ASOS (SCA), are deployed in extremely remote and severe climate locations and require redundant extended temperature range boards. Based on funding availability, the implementation sequence for all 884 *NWS and FAA* locations will occur in three phases. Phase I was funded with Fiscal Year (FY) 2001 funds and includes the locations in the Operational Acceptance Test (OAT), (10 FAA, 22 NWS, and 4 NWS SCA). Phase II was also funded with FY 2001 funds and includes 197 FAA, 264 NWS and 23 NWS SCA. Phase III is being funded with FAA FY 2002 funds and includes the remaining 364 FAA locations.

A check list is provided to aid in monitoring progress in completing the necessary activities for operational implementation. The check list ensures that prerequisite System Test (ST) and OAT activities are completed prior to start of the operational implementation. It then covers pre-operational implementation planning actions involved in site identification, deployment strategy, maintenance and logistics planning, training, and user notification. The check list identifies the executable functions and deliverables in the implementation of the new Processor Board. Finally, any necessary post-

implementation activities are also covered, including documentation and disposition of old equipment.

This plan is written from the time perspective of imminent operational implementation. It assumes all necessary activities prior to operational implementation were, or *will have been*, completed and operational implementation activities are about to begin.

List of Organizational Codes

Code	NWS Organization
CCx2	National Logistics Support Center
OPS11	Engineering & Acquisition Branch
OPS12	Maintenance Branch
OPS13	Configuration Branch
OPS14	Logistics Branch
OPS22	Observing Systems Branch

WSOM	Weather Service Operations Manual
WFO	Weather Forecast Office
WSP	Weather Systems Processor

1. INTRODUCTION

1.1 Description of Technology Improvement Scheduled For Implementation

The Automated Surface Observing System (ASOS) processor upgrade consists of a new single Processor Board with expanded memory and processing capability to handle new high performance sensors with higher speed, greater reliability, and communication enhancements. These improvements are necessary to keep pace with the expanding demands placed on the ASOS for timely, accurate delivery of more observation parameters to more external users in real time. The existing Processor Board is based on a design over 10 years old. It cannot handle the expanded demands for data processing of new sensors, and dissemination of a myriad of data to more operational users in real time. The new Processor Board will serve as the launch platform for a host of new software and sensor applications. As part of the NWS modernization effort, key bottlenecks in the ASOS hardware platform are being upgraded. In particular, the Central Processing Unit (CPU) board is being upgraded from a 68010 at 10 MHZ to the PowerPC at 300 MHz, the Random Access Memory (RAM) is enhanced, Flash memory is being added, and the underlying kernel is being upgraded to include support for Transmission Control Protocol/ Internet Protocol (TCP/IP) connectivity.

1.2 Purpose

The purpose of this document is to provide a clear strategy for the implementation of the new Processor Board into the ASOS and minimize field operational impacts resulting from this modification. Furthermore, this plan delineates major implementation activities and organizational responsibilities required for a smooth transition into operations.

1.3 Scope

This plan covers implementation related activities starting with System Test (ST) preparation and ending with commencement of operations. This plan describes the extent of implementation related activities: the pre-implementation testing and operational readiness evaluation activities (described in Chapter 2); the pre-operational implementation activities (described in Chapter 3); the operational implementation activities (described in Chapter 4); and the post-operational implementation activities (described in Chapter 5). *This plan includes provision for a "Phased Implementation" approach as opposed to a single master schedule for all sites. The phased implementation approach breaks the entire population of sites into discrete implementation batches. Each batch consists of sites with similar characteristics and implementation risks. Implementation risks are changes to the existing suite which are more likely to result in failure. This includes complex modifications, complex configurations, and critical external components such as network communications which are beyond the control of ASOS. Those sites with the least operational risk are in the earlier batches, while those sites with the greater operational risk are in the latter batches. Batches are implemented sequentially as confidence is gained. The batches may be implemented with some overlap.* Furthermore, this plan describes any unique additions, exceptions, or limitations. For example, unlike other improvements , the new Processor does not require completion of a follow-on Climate Data Continuity Study.

*This plan applies to all **884** NWS and Federal Aviation Administration (FAA) ASOS locations. The implementation of the new processor board falls within the overall goal of modernizing the ASOS network. This implementation is phase Iof this modernization. Consequently, this implementation plan is labeled Addendum I.*

1.4 Applicable Documents

The following documents serve as a part of this plan:

- Engineering Modification Note # 73
- Field Release Note
- Operational Acceptance Test Plan

2.0 TEST ACTIVITIES

This chapter gives a brief overview of the test activities which precede, and lead to Operational Implementation (OI) activities. The pre-implementation test activities are the transition between development activities and OI activities. The sections in this chapter describe the test-related activities, are given in general serial order of completion, and identify the office(s) primarily responsible for their accomplishment. They are pre-ST activities, ST activities, pre-Operational Acceptance Test (OAT) activities, and OAT activities. These activities are necessary to determine if the product improvement is ready for full production and implementation.

2.1 Pre-System Test Activities

The following activities must be completed before the start of the ST.

1. **Prepare Request For Change (RC):** Prior to successful completion of the factory System Integration / Qualification Tests, the Programs and Plans division (OST1) will have submitted a Request For Change (RC), through the ASOS Change Management process, to begin the ST and OAT process. The ASOS Program Management Committee (APMC) is the approving management authority for this process. Management approval of this RC was based on the NWS Engineering & Acquisition branch (OPS11) Contracting Officer Technical Representative (COTR) certification of successful completion of the factory System Integration / Qualification Tests.

2. **Prepare ST Plan:** The NWS Test & Evaluation Branch (OPS24) prepared and distributed the ST plan prior to start of the ST. This plan includes all activities and deliverables for successful completion of the ST and a draft outline of the ST report. A test team was formed to support all test activities.

3. **ST Locations and Dates:** ST locations, schedules, and test procedures are determined and managed by OPS24. Selection of ST locations will have been made by OPS24 prior to start of the ST. The test dates were determined by OPS24 prior to the start of the ST. The Processor Board ST was conducted at the following locations:
Sterling Research & Development Center and National Weather Service Headquarters

4. **Acquisition of ST Units:** Upon successful completion of the factory System Integration / Qualification Tests, OST1 initiated procurement of the ST Processor Board Planned Product Improvement (PPI) components and delivery of these components to the designated ST locations. The NWS Maintenance Branch (OPS12) ensured delivery of the necessary test equipment to the designated ST locations.

5. **ST Logistic Support:** Necessary components, supplies, spare parts, and test equipment were made available to the ST locations.

6. **Prepare & Provide Modification Notes (MOD NOTEs):** Draft Engineering Modification Notes MOD NOTEs were produced by OPS12 and provided to installation technicians prior to start of the ST.

7. **Install Test Units at ST Sites:** Installation and maintenance of ST equipment was coordinated by OPS12.

2.2 System Test (ST) Activities

The following activities were accomplished during or before the end of the ST.

1. **Verify Start of ST:** OPS24 reported the start of the ST.

2. **Data Collection and Analysis:** All necessary data were collected, compiled and checked for quality and completeness in accordance with the ST plan. All Test Trouble Reports (TTRs) were reviewed and reconciled. This process is managed by OPS24.

3. **Verify Completion of the ST:** Where the ST identified serious flaws, additional STs were conducted. *During testing, OPS24 will inform the TRG of the results of the test. The TRG will recommend whether or not to proceed to the next phase of testing (i.e., OAT).*

4. **ST Report:** A preliminary test report was prepared and issued for review by OPS24 as the ST neared completion. This includes an assessment of all outstanding Test Trouble Reports (TTRs) and a recommendation whether *or not* to proceed with the follow-on OAT. *The program manager reviewed the recommendation and made the decision weather to proceed to OAT.* When the recommendation was issued to continue with the OAT, OPS24 provided preliminary written notification to the ASOS Configuration Control Board (ACCB) of satisfactory completion of the ST with a recommendation to issue a revision to the current Request for Change (RC) or issue a new RC to begin the OAT for this technological improvement. OPS24 subsequently completed and delivered the final ST report to the ACCB for consideration and management decision prior to the completion of the OAT.

2.3 Pre-Operational Acceptance Test Activities

The purpose of the OAT is to verify operational performance of the Processor Board under field conditions. In effect, this is a “dry-run” for the full implementation for the remaining sites.

The following activities must be completed prior to start of the OAT.

1. **RC for OAT:** Upon receipt of the preliminary ST report and a recommendation from OPS24 to proceed with the OAT, the Chair of the ACCB (i.e., ASOS PPI Manager (OST1)) initiated action to prepare and submit an RC for the OAT. This RC lists all locations included in the

OAT. The preparation of the final ST report and the RC for the OAT proceeded in parallel and were both completed before the start of the OAT.

2. **Operational Acceptance Test Management Decision:** Upon completion and delivery of the final ST report to the ACCB, by OPS24, the ACCB will have made a decision through the Change Management process whether to proceed with the OAT. If the incremental cost to proceed to the OAT is equal to or greater than $1 million then the management decision authority to proceed with the OAT resides with the APMC. If the incremental cost to proceed to the OAT is less than $1 million, then the the management decision authority to proceed with the OAT resides with the ACCB. Normally, the incremental cost is less than $1 million. In the case of the Processor Board, the incremental cost was less than $1 million and therefore the ACCB exercised the OAT management decision. When the RC to proceed with the OAT was approved and a decision made to proceed, the ACCB Chairperson (OST1) notified OPS11 to procure the planned quantity of equipment components necessary for the OAT. This decision and notification was made upon receipt of the final test report. Under special circumstances to meet critical deadlines, the decision to proceed with the OAT could be made based on the preliminary ST report provided no major changes are expected in the final ST report.

3. **Prepare OAT plan:** OPS24 prepared and distributed the OAT plan prior to start of the OAT. This plan identifies the OAT locations, dates, schedules, responsibilities, procedures, metrics, evaluation criteria and deliverables (data reports, evaluations, and recommendations) for successful completion of the OAT. This was done on September 19, 2001.

4. **OAT Locations and Schedule:** The OAT locations were determined by OPS24 in coordination with the NWS Observing Systems Branch (OPS22), NWS regions, and FAA. The sites selected for the OAT were chosen to ensure a representative sample of operational locations are evaluated. The criteria for selection include: site system configuration, site communications interfaces, and diversity of climatic regimes. This later criterion was imposed because the Dew Point OAT may start before the processor OAT ends (i.e., overlapping OAT). A site selection matrix was used to make this determination. Selection of OAT locations was made prior to the start of the OAT. The test dates were determined by OPS24 prior to the start of the OAT. See the OAT plan for further details.

5. **Acquisition of OAT Units:** OST1 initiated action for acquisition of the OAT units. Upon notification by the ACCB Chairperson (i.e., ASOS PPI Manager (OST1)) to proceed with acquisition of OAT equipment, OPS11 (acting as the COTR) acquired the planned OAT equipment and coordinated with OPS24 and the NWS regions the locations where the equipment will be delivered before the start of the OAT.

6. **OAT Logistic Support:** OPS12 ensured all necessary Modification Kits, maintenance components, supplies, spare parts, and test equipment were delivered to the designated OAT locations and installed prior to the start of the OAT. OPS12 coordinated with the Configuration Branch (OPS13) and Logistics Branch (OPS14) the assignment of test equipment part numbers and reference designators.

7. **OAT Maintenance Coordination Support:** OPS12 coordinated plans for installation and maintenance of the OAT Modification Kits (MOD KIT) with the NWS regions, and the Electronics Technician (ET) responsible for each OAT site prior to start of the OAT.

8. **OAT Documentation Support:** All necessary documentation was delivered to the NWS regions and the test sites prior to start of the OAT. This documentation includes: The Engineering Modification Notes produced by OPS12; The OAT procedures as contained in the OAT Plan produced by OPS24, and; a draft ASOS Release Note (REL NOTE) for software version 2.6X prepared by OPS22.

2.4 Operational Acceptance Test Activities

The OAT may be conducted in either a single phase or a multiple phase mode. In the single phase mode, the OAT is applied simultaneously to all sites. In the multiple phase mode, the OAT is applied sequentially to selected sub-groups of sites until all sites successfully complete the OAT. The successful completion of the OAT for one group does not preclude the start of the OAT for another group; as such OATs for multiple groups of sites can be conducted simultaneously. The initial group consists of similar sites with the greatest chance for successfully completing the OAT. Subsequent groups are incrementally added to the OAT as confidence is gained and necessary modifications are made until all sites successfully complete the OAT. A designated "group" of sites in the OAT is representative of the larger "batch" of subsequent similar sites to be implemented. The following activities must be accomplished during and completed before the end of the OAT.

1. **Verify Start of OAT:** OPS24 informed the test team of the times, places, and procedures for the OAT. This was done through ongoing coordination and formal issuance of the OAT plan.

2. **Data Collection and Analysis:** All necessary data was collected, compiled and checked for quality and completeness in accordance with the OAT plan. This process was managed by OPS24.

3. **Verify Draft OI Plan:** A key element of the OAT is the verification of the implementation procedures in the draft Operational Implementation Plan (OIP). In effect, the OAT was a "dry-run" for the OI. OPS12 ensured the draft OIP procedures were followed during MOD KIT installation and checkout at the OAT locations. OPS24 monitored this process, and reported any discrepancies found to OPS22. All reported discrepancies were rectified by OPS22 in the final OIP.

4. **Verify Completion of OAT:** If the OAT had a significant failure, a new successful ST and OAT were necessary after corrective action was completed. When the OAT was successfully completed, OPS24 informed the test team that full implementation of the new Processor Board can commence.

5. OAT Report: *The Processor Board OAT was subdivided into discrete test groups, each group representing a designated phased implementation batch of sites. The list of sites contained in each phased implementation batch is coordinated and provided separately by the ASOS PPI Manager. A preliminary OAT report was prepared by OPS24 for each group of test sites. Each preliminary OAT report includes an assessment of all outstanding TTRs which impact the group and a recommendation whether to proceed with the follow-on phased OI. A negative report resulted in remedial action and repeat of the OAT. Upon receipt of a positive OAT report (i.e., successful completion) from OPS24, the ASOS PPI Manager will conduct a Deployment Readiness Review (DRR) with other managers to make a go-no-go deployment decision for the designated batch of phased implementation sites.*

3.0 PRE-OPERATIONAL IMPLEMENTATION ACTIVITIES

This chapter gives a brief overview of the activities which immediately precede and lead to OI activities. These pre-implementation activities are the transition between the test activities and OI activities. The sections in this chapter describe the pre-implementation activities necessary to initiate the follow-on implementation activities and identify the office(s) responsible for their accomplishment. These activities are planning activities, logistic support activities, and documentation activities. They are accomplished in parallel and are completed by the start of the OI which occurs when the new Processor Board is installed and operationally activated at the first site following completion of the OAT. The following activities should be accomplished before the start of the OI.

3.1 Planning Activities

This section describes those plans and associated decisions which must be completed before the start of the OI. This description identifies the office responsible for completion of each plan or related decision. This a dynamic process with variations from the norm. These planning/decision activities include:

1. **Depot Spares Modeling:** Mean time Between Failure (MTBF) statistics was used by OPS14 to run a depot spares model to determine how many spares are needed to operationally support the new Processor Board. A MTBF of 182,000 hours and 884 operational systems were used to compute the required number of spares needed. This number was provided to the ASOS PPI Manager (OST1) prior to full scale production and acquisition management decision.

2. **RC for OI:** Concurrent with preparation of the preliminary OAT report and a recommendation from OPS24 to proceed with the OI, the Chair of the ACCB (i.e., the ASOS PPI Manager (OST1)) initiated action to prepare and submit an RC for the OI. This RC contains an Engineering Change Notice with parts to be added and/or deleted to/from the base line and lists all locations included in the OI. The ACCB considered the preliminary OAT report and recommendation in their deliberations and voting on the RC. The completion and provision of the final OAT report and favorable recommendation for implementation by OPS24 to the ACCB is a prerequisite for initiating the acquisition activities for the OI.

3. **Full Scale Production and Acquisition Management Decision:** *If the RC is not approved by the ACCB, it will be referred back to the submitter for rectification and resubmission in accordance with established ACCB procedures.* Upon ACCB approval of the RC for the OI, the ASOS PPI Manager (OST1) endorsed the RC and recommend to the APMC they approve the recommendation and issue a management decision to proceed with the OI. As the Chair of the APMC, OPS2 coordinated the APMC management decision making process. Upon receiving the APMC management decision, OST1 notified ASOS PPI Contracting Officer Technical Representative (COTR), OPS11 to procure the planned quantity of equipment components necessary for the OI. This notification will customarily be made upon receipt of the final OAT

report and recommendation to proceed with the OI. If the final OAT report did *not* support proceeding with the OI, then OST1 would have suspended procurement activity until the critical issue(s) cited in the report were satisfactorily resolved. *However, in this case, the procurement notification was actually made with acceptable minimal risk prior to receipt of the final OAT report to meet critical schedule deadlines.* The actual procurement may occur in batches and staggered delivery dates which coincide with the planned deployment schedule.

4. **Prepare OI Plan:** OPS22 will develop and coordinate the execution of the overarching OIP for all ASOS Planned Product Improvements (PPI), and the specific OIP for each PPI component. This OIP addresses the OI for the new ASOS Processor Board upgrade. It defines all activities for successful completion of the Processor Board OI and, as such, forms a part of the master OIP.

5. ***OI Deployment Decision.*** *Upon successful completion of either the full, or partial phased group OAT and receipt of the OAT report from OPS24, the ASOS PPI Manager will conduct a Deployment Readiness Review (DRR) with other managers to make a "go-no-go" deployment decision for the larger batch of similar sites in the general population represented by the smaller group of sites referenced in the OAT report. A "Go" deployment decision will be announced by the ASOS PPI Manager to all concerned parties. This will allow deployment planning and execution activities to continue to completion for the designated batch of sites.*

6. **Identify OI Installation Locations:** OPS22 will coordinate the selection of locations for each procurement batch with the appropriate NWS and FAA offices and solicit their input to this decision. This implementation plan only addresses the 882 ASOS locations in the combined NWS and FAA base program plus two additional post-base FAA locations (total 884 locations). These locations are identified on page 9 of Appendix II.

7. **Develop OI Strategy:** A key element of the OIP is the implementation strategy. Since not all Processor Board kits will be available initially to all technicians, *an overarching installation* strategy is needed to ensure equitable distribution *of MOD KITs* during the production cycle. OPS22 will establish the draw rate strategy for the Processor Board kits and the installation sequence strategy. The basic elements of these strategies are described below.

A. **Draw Rate Strategy:** Initially, OPS12 will issue the first two Processor Board kits to each Weather Forecast Office (WFO) as stock is received at National Logistics Support Center (NLSC). These first two kits *are* the spare kit plus the first installation kit. The first WFOs to receive the initial issue of two Processor Board kits will be to those WFOs which have ASOS locations included in the Ice Free Wind (IFW) sensor OAT. The remaining WFOs will receive the initial issue of two processor boards in the order specified by the NWS region. Concurrent with this initial distribution, the receiving WFOs will be instructed by OPS12 on how to draw additional kits from NLSC (CCx2) in accordance with the MOD NOTE #73 issued by OPS12. Upon completion of the initial issue of two processor boards to each WFO, NLSC will distribute subsequent processor boards to WFOs upon receipt of a draw request from the WFOs. The NWS regions are

responsible for establishing a regional draw rate strategy in consonance with the region's share of the national total, and monitoring and modifying the WFO monthly draw requests as necessary. The NWS regions will provide guidance to their WFOs on the draw sequence within the region. The NWS regions will inform OPS12 of the draw sequence within the region and will report the regional monthly draw rate status to OPS22.

WFOs are to draw only those additional kits they plan on installing within the next 30 days. No more than one draw request should be submitted by each WFO to NLSC in a calendar month. NLSC will strive to fill the draw requests in the order they are received.

B. Installation Sequence Strategy: The initial kit acquired by each WFO must be set aside for use as a spare. *The spares kit includes those components most likely to require maintenance, repair, or replacement, whereas the operational MOD KIT contains all components needed for complete installation and operation.* The succeeding *operationa*l *MOD KITS may* be implemented with consideration of the following criteria:

1. The OI may be conducted in either a single phase or a multiple phase mode. In the single phase mode, the OI strategy is applied simultaneously to all sites. In the multiple phase mode, the OI strategy is applied sequentially to selected sub-groups of sites until all sites successfully complete the OI. The successful completion of the OI for one group does not preclude the start of the OI for another group. The initial group consists of similar sites with the greatest chance for successfully completing the OI. Subsequent groups are incrementally added to the OI as confidence is gained and necessary modifications are made until all sites successfully complete the OI.

2. The first group of sites to be implemented are those sites (10 FAA & 26 NWS) included in the OAT for the new processor. This group includes the 20 climate continuity sites needed for the dew point sensor OAT. These sites are operationally implemented at the conclusion of the OAT process. See page 3 of Appendix II, for this list of Processor Board OAT sites.

2. The second group of sites to be implemented are those 20 (NOMINAL NUMBER) sites included in the IFW sensor OAT, with precedence given to those in this group which are IFW climate continuity study sites. This is because the IFW OAT is planned to begin before the implementation of the processor boards is completed. The sites selected for the IFW climate study require dual wind instruments and cannot be sites with Backup Ceilometers. This is because of bandwidth limitations and timing contention between the ASOS Acquisition Control Unit (ACU) and Data Collection Platform (DCP). The Observing Services Division (OS7) is responsible for selecting these IFW climate continuity study sites. The remaining sites in the IFW OAT are selected by OPS24 based on other considerations, such as site configuration. See page 4 of Appendix II, for

list of IFW OAT sites.

3. The last group of 99 sites to be implemented are those locations with specialized software loads which must remain on the old Processor Board until these loads are rehosted on the new Processor Board after the new board is implemented. The sites with these specialized software loads include 34 Weather System Processor (WSP) sites and 42 Terminal Doppler Weather Report (TDWR) sites with software load 2.63 (total 76 sites), and 23 Ice Accretion remark evaluation sites with software load 2.62I. See pages 5-8 of Appendix II for list of WSP/TDWR & Ice Accretion sites.

4. Of the884 sites in the ASOS base program/post-base (313 NWS and 571 FAA) scheduled to receive the new Processor Board, the vast majority, 724 sites, fall between the second group and the last group. The number of sites in this middle group is the difference between the total number of base program sites, (884 sites) minus the number in the first group already implemented (36 sites), the second group of 20 IFW sites, and the last group of 99 WSP/TDWR/Ice Accretion sites. These sites should be deployed within each region in the general following order:

   - non-airport sites
   - non-Automated Weather Observing System/Automated Surface Observing System Data Acquisition System (ADAS) sites
   - "non-problem" ADAS sites
   - "problem" ADAS sites

   Further preference should be given to sites with greater dew point maintenance problems and associated maintenance costs. Consideration should also be given to scheduling sites on the same day which are closely spaced wherever possible. The details of the implementation order for this middle group is left to the regions.

- A major consideration in the implementation schedule for the middle and last group is the timely purchase and acquisition of processor boards. The procurement/acquisition strategy is to purchase sufficient quantity of standard temperature range single processor boards for installation in the ACU at 857 sites plus 20% spares (total 1027 ACU boards), and purchase sufficient quantity of extended temperature range dual processor boards for use at the 27 Single Cabinet ASOS (SCA) sites (54 Boards) plus 10% spares (total 60 SCA boards). This strategy is shown in the following three tables.

  Thus far, Fiscal Year (FY) 2001 funds have purchased 75 boards for 36 OAT sites (10 FAA & 22 NWS ACU sites; 4 NWS SCA sites) plus 40 spares (38 ACU and 2 SCA). Additional FY 01 funds have purchased another 650 boards for 489 sites (all remaining 264 NWS ACU sites, all remaining 23 NWS SCA sites, and

202 FAA ACU sites) plus 138 spares (134 ACU and 4 SCA). When FY 02 funds are received from FAA, 362 boards will be purchased for the remaining 362 FAA ACU sites (no additional spares are required).

With Initial FY 01 NWS & FAA Funds:	**OAT SITES**			
	ACU		**SCA**	**TOTAL**
	FAA	**NWS**	**NWS**	
BOARDS	39	26	10	75
SPARES	34	4	2	40
SITES	10	22	4	36

With Additional FY 01 NWS & FAA Funds:				
	ACU		**SCA**	**TOTAL**
	FAA	**NWS**	**NWS**	
BOARDS	282	318	50	650
SPARES	80	54	4	138
SITES	197	264	23	484

With FY 02 FAA Funds (When Available):				
	ACU		**SCA**	**TOTAL**
	FAA	**NWS**	**NWS**	
BOARDS	364	0	0	364
SPARES	0	0	0	0
SITES	364	0	0	364

Grand Total:

1087 Boards (1027 ACU, 60 SCA)
178 Spares (120 ACU @ WFO, 52 ACU @ NLSC, 6 SCA @NLSC)
884 Sites (286 NWS ACU, 27 NWS SCA, 571 FAA ACU)

- Within this framework, the following implementation scenario will occur:

  For OAT Sites:

  1. Issue 27 ACU processors to 27 WFOs for installation at first 27 locations (22 NWS, 5 FAA)
     Issue 8 SCA processors to 4 WFOs for installation at first 4 NWS locations (Note: each of these locations receives 2 processor boards)
     Issue 27 ACU processor spares to 27 WFOs for OAT
     Put 11 ACU processor spares in stock at NLSC;
     Put 2 SCA processor spares in stock at NLSC

2. Issue 186 ACU processors from NLSC to remaining 93 WFOs for installation at next 93 NWS locations (1 spare + 1 for installation for each WFO)
   Put 40 ACU processor spares in stock at NLSC
   Note: At this point all 120 WFOs have 1 spare ACU processor and NLSC has 51 ACU spares

3. Issue 23 SCA processors from NLSC to 23 WFOs for installation at last 23 NWS locations
   Put 4 SCA processor spares in stock at NLSC
   Note: At this point NLSC has 6 SCA spare.

4. WFOs draw 172 ACU processors from NLSC for installation at last 172 NWS locations
   WFOs draw 202 ACU processors from NLSC for installation at next 202 FAA locations

Note: In effect, 99 of these NWS & FAA sites are included in the WSP/TDWR support and Ice Accretion test batch and will be set aside as the last to be implemented. See pages 5-7 of Appendix II, for a list of these sites. This only leaves a combined total of 275 sites for implementation in this batch. At this point a total of 421 of the 884 sites will be implemented. The NWS Regional Focal Point (RFP) will monitor to ensure these 99 sites are not implemented until the software in the new processor is upgraded to include WSP/TDWR and Ice Accretion functionality.

Pending FAA FY 02 Funds:

5. WFOs draw 364 ACU processors for installation at the last 362 FAA locations. At this point 785 of the 884 sites will be implemented.

More guidance is to be provided on # of NWS and FAA sponsored sites to be implemented last and how this may affect schedule if FAA FY 02 funds are not received before step 4 is completed (i.e., as many as 99 of the 172 NWS sites in step 4 may have to be deferred until after the 364 FAA sites in step 5).

6. WFOs draw 99 ACU processors for installation at 76 WSP/TDWR sites and 23 Ice Accretion sites. At this point all scheduled base program sites are implemented. Note: The ice accretion test on the old processor board will end on April 15, 2002. Two of these sites are collocated with WSP/TDWR. These sites are Des Moines (DSM), IA, and Raleigh/Durham (RDU), NC. These sites will still require the use of the

old processor through the end of the WSP/TDWR testing period. The other 21 ice accretion sites are free to be installed with the new processor after April 15, 2002.

3.2 Logistic Support Activities

1. **Procurement:** Full production and procurement of the new Processor Board and associated equipment and their delivery to NLSC will be managed by OPS11. This function includes serving as the COTR. Upon notification of approval of the full production contract award by the ACCB, OPS11 will coordinate the issuance of the production contract with the Contracting Officer (CO). A production rate and procurement schedule will be established by OPS11 at time of contract award.

2. **Logistic Support Strategy:** All procured full production processor boards will be entered into the supply channel through the NLSC. OPS14 will establish national stock numbers for the new Processor Board kits.

Note: the ACU kit is different from the SCA kit. The MOD NOTE for this installation issued by OPS12 will inform field technicians how to order this kit. Note: each WFO having an ASOS technician must have on hand a spare kit before installing their first site.

3. **Installation and Maintenance Coordination:** In the case of the new Processor Board, no maintenance training is necessary. However, the existing course at the NWS training Center will be modified to include the new processor.

3.3 Operational Support Activities

This section describes those documentation, training, user notification, and validation activities which must be completed before the start of the OI. This section identifies the office(s) responsible for completion of each activity. These activities include:

1. **Documentation:** The following documentation will be provided to the implementation and operational personnel at the responsible WFO prior to OI of a given site:

   A. Engineering MOD NOTES will be provided to WFO technicians by OPS12 for installation and follow-on maintenance activities. This will occur prior to the start of scheduled OI of the first full production Processor Board in the WFO's area of responsibility. In the case of the Processor Board, the MOD NOTES include instructions on installation and checkout to ensure all interface functions and system displays are identical to the old Processor Board with software version 2.60. The display will show the modified software version installed on the new processor board, vice version 2.60.

B. Operational Release Notes will be provided by OPS22 to the NWS ASOS Regional Focal Point (RFP) for distribution to affected WFOs prior to the start of the scheduled OI of the first processor boards in their region. These release notes will also be distributed by OPS22 to designated FAA and DOD focal points for distribution to their affected facilities.

C. Normally, any update to Weather Service Operations Manual (WSOM) chapters will be provided by the appropriate Weather Service Headquarters Office to the WFOs prior to OI. **In the case of the Processor Board, no WSOM updates are planned.**

D. Normally, any update to the ASOS Users' Guide and other related ASOS documents will be provided to the WFOs and other affected other Federal agencies (FAA, DOD) by OPS22 prior to OI. **In the case of the Processor Board, no ASOS Users' Guide updates are planned.**

2. **Training:** All training for responsible operators and maintenance personnel will normally be completed prior to OI. **In the case of the Processor Board, there is no functional change and therefore no observing or maintenance training required.**

3. **Pre-Implementation User Notification:** Any planned change in operations or disruption in service must be documented and distributed to the affected user community prior to actual execution of the change. *OPS22 will coordinate with various organizations to ensure these notifications are disseminated.* **In the case of the Processor Board, there is no planned change in operations or disruption in service, and therefore no notification is required.**

4. **Verify completion of all Pre-OI Activities:** The preceding activities must be completed before commencement of the OI activities. The OPS22 Implementation Manager will ensure all prerequisite activities are verified as completed. Furthermore, OPS22 will have informed the implementation team of the schedules, responsibilities, and procedures for the OI. This was done through ongoing coordination and formal issuance of the OIP.

4.0 OPERATIONAL IMPLEMENTATION (OI) ACTIVITIES

This chapter gives a comprehensive description of the OI activities. The sections in this chapter describe the implementation activities necessary to initiate operational activation of the product improvement and identify the office(s) responsible. These activities include: Implementation Management, Acquisition, Installation, and Implementation. They are accomplished in parallel during the OI activity phase.

4.1 Implementation Management Activities

1. **Oversight Responsibilities:** OPS22 has overall responsibility for managing and coordinating the OI activities. These responsibilities include ensuring the implementation is executed according to plan and coordinating any necessary adjustments with other key participants. This includes coordination with: OPS24 for managing the successful completion of all prerequisite testing prior to OI; OPS11 for monitoring acquisition and delivery of MOD KITS and other material necessary for implementation to NLSC; OPS14 for managing the logistics supply, repair; OPS12 for managing the distribution of OI MOD KITS and other materials, and the installation and maintenance activities; and the NWS Regional Focal Point (RFP) for managing and coordinating all implementation activities within their respective regions.

   The RFPs have a unique responsibility to fine tune and manage the implementation sequence within the region, and coordinate with the local WFO to resolve implementation issues and ensure a successful implementation. The RFPs will compile and forward 30-day implementation status reports to OPS22 via E-Mail. These status reports will include the newly completed Checklist, Part B and the 30-day Evaluation Reports from the WFO.

2. **Check List:** A key component of the oversight responsibilities is monitoring the status and progress of the implementation. A two part check list tool has been developed to assist in this activity. The purpose of the check list is to ensure that all essential activities described in this document are completed as scheduled. The check list follows the general organization of this plan.

   Part A: This part is completed once by OPS22. It applies to all locations subject to OI. It is completed prior to the beginning of the OI process for the first full production Processor Board.

   Part B: This part is initially completed by the responsible WFO for each site implemented. The Meteorologist-In-Charge (MIC) at each WFO is responsible for ensuring this check list is completed and sent forward in a timely manner. This includes annotating the check list with the completion dates (mm/dd/yy) of those items for which the WFO is designated as the Office of Primary Responsibility (OPR), and attaching a brief narrative which describes any problems encountered and any solutions found or recommended. Both the check list and narrative will be forwarded via e-mail to the RFP upon completion. The RFP will compile these check lists and

narratives into a monthly e-mail report to OPS22. OPS22 will coordinate with the designated OPRs to ensure that the remaining items are completed.

4.2 Acquisition Activities

1. **Verify Start of OI:** OPS22 will verify the start of the OI.

2. **Monitor & Validate Delivery:** As the COTR, OPS11 will monitor and ensure timely delivery of all planned production units to the NLSC. Any discrepancies or delays in scheduled delivery of the Processor Board to NLSC will be reported by NLSC to OPS11 in a timely manner. Throughout the production cycle, OPS11 will perform a quality assurance function on units being delivered to the NLSC, report any discrepancies, and provide remediation recommendations to the CO.

3. **Stock Kits at NLSC:** The new Processor Board and associated parts needed for installation will be stocked as a kit at NLSC. There are two basic types of kits for the new Processor Board. One kit is for a single processor ACU installation (ACU kit), and the other is for a dual processor SCA installation (SCA kit). A National Stock Number (NSN) will be established for each type of kit by the Logistics Branch (OPS14). *A subsequent management decision was made that all sites including SCA sites will get only 1 processor. Additionally, SCA sites will receive the single processor with extended temperature boards.* Procedures for requisitioning this kit will be disseminated to field installation technicians by OPS12 at the start of the OI. OPS14 will manage all logistic support for the implementation of the new ASOS Processor Board. NLSC will manage inventory of all necessary supplies, spares, and modification kits, and filling orders from field technicians for dissemination of Processor Board kits.

4. **Requisition Kits from NLSC:** The first two ACU kits will be issued to each WFO by OPS12 from the stock at NLSC. This includes one spare and one initial kit for installation. For all subsequent installation kits, the WFO Electronics Technician (ET) will requisition the appropriate Processor Board kit (ACU or SCA) from NLSC when they are ready to install the Processor Board in accordance with the Draw Rate Strategy described in Section 3.1, 5A.

4.3 Installation Activities

1. **Downloading of Archive:** At the start of the installation process, prior to system power down and installation of the new Processor Board, the ET will download the ASOS archive data sets to a laptop and copy these files to a disc using direct command mode as described in the installation MOD NOTES. These data sets include, but are not limited to, the 5-minute observations, the SYSLOG, the Edit Log, the Daily and Monthly Summary Data, and the Standard Hydrometeorological Exchange Format (SHEF) data. The disc containing this archive data will be provided to the Data Acquisition Program Manager (DAPM) at the local responsible WFO.

The DAPM, the lead Hydrometeorological Technician, or the Information Technology Manager, as appropriate, will extract current climate records from the disc and forward them to NCDC for archive, and retain the disc for 60 days for possible future use.

2. Installation & Checkout: Field technicians will perform installation and checkout of the Processor Board in accordance with Engineering MOD NOTE 73. Generally this process will take about two hours or less. Key activities include:

A. Make a hard copy of selected system configuration and maintenance screens prior to removal of the old XYCOM memory boards. This will be used as comparison to ensure configuration screen displays remain unchanged after installation.

B. Perform installation of new processor board.

C. Ensure the latest software version 2.6 rehost is loaded on new processor board.

D. Start system/cold boot.

E. Complete ASOS Operations and Monitoring Center (AOMC) download.

F. Verify the DCPs are providing data from the configured sensors. Turn on report processing. Let system run for 15 minutes. Note: Step G may be completed during this 15 minute period.

G. During the first 15 minutes, compare new configuration screens with those printed prior to installation. Verify the new configuration is identical to the configuration downloaded from the old XYCOM boards.

H. Also during the first 15 minutes, verify the connected peripherals are displaying ASOS algorithm output as before installation. Exception: The "SKY" condition field will initially contain missing data elements (MM) for 30 minutes.

I. After a total of 30 minutes, verify "SKY" condition output data are now displayed on peripherals.

J. Wait for and verify dissemination of the next hourly Aviation Routine Weather Report (METAR).

K. Check maintenance page and clear all data quality errors, as appropriate.

L. Annotate the ASOS maintenance page of installation action and update Engineering Management Reporting System (EMRS) as appropriate.

M. Installation at this site is now complete.

4.4 OI Monitoring & Coordination Activities

1. Installation Notification: Upon successful completion of installation and checkout, the ET will update the EMRS in accordance with MOD NOTE 73 and notify, via e-mail, the responsible WFO, the RFP, and the AOMC of this occurrence.

2. Initiate Maintenance Monitoring Confirm Operations:

A. **WFO Status Monitoring:** The WFO in conjunction with the AOMC will begin routine maintenance monitoring.

B. **30-Day Evaluation Report:** The WFO will also conduct a detailed 30 consecutive day meteorological monitoring and evaluation of the data from the newly implemented site to ensure the data are complete, consistent with expected local conditions or independently confirmed as representative of unique meso-scale phenomena, and the system is operating normally. All discrepancies will be noted and reported to the RFP in a timely manner. Upon the conclusion of the 30-day monitoring period, the WFO will complete and forward to the RFP a narrative report on the results of the monitoring and evaluation, along with any recommendations. The report shall include the identification of the location evaluated, the dates of the evaluation, the office and person conducting the evaluation, and the narrative. The narrative shall include a description of any discrepancies found which relate in any way to the implemented change, and any solutions which act on the discrepancy.

C. **RFP Status Monitoring:** The RFP will closely monitor the status of the installation, checkout and OI. The RFP will conduct periodic teleconferences with the field to assess installation, maintenance, and meteorological performance. When necessary, they will initiate timely corrective actions which are beyond the capability of the local WFO. They will also collect and compile the 30-day implementation reports from the WFOs and forward them in monthly reports to the OPS22 Implementation Manager via e-mail.

D. **AOMC Status Monitoring:** The AOMC will monitor the operational status of the newly implemented ASOS site for
30 days to ensure proper functioning and availability of data from that site. The AOMC will monitor and report on the status of the implementation and apprise the OPS22 Implementation Manager of any unusual ASOS performance related to the implemented improvement during the 30-day close monitoring period.

3. Installation Status Reporting Coordination:

A. Status accounting is a routine configuration management function provided by OPS13. The AOMC will monitor the installation and implementation status of every site and provide daily

reports. These reports will be provided through the ASOS Implementation List Server (ASOS_Implementation@infolist.nws.noaa.gov) And posted on the Surface Observing Program Web Site: **http://www.nws.noaa.gov/ops2/Surface/index.htm**.

B. OPS22 will monitor the status and track the progress of the implementation from daily AOMC reports, periodic reports from the EMRS, Configuration Management Information System (CMIS), and Management Information Reporting System (MIRS), and monthly reports provided by the RFP. OPS22 will use these reports to provide weekly staff note updates for mid- and upper-level management on the status of the implementation, and initiate remedial coordination actions to resolve any difficulties and keep the implementation on schedule. The OST1 ASOS Product Improvement Manager will use these reports to update monthly/quarterly management Quad Chart reports for senior management briefings. OPS22 will also ensure that drafts, updates, data bases, and other documents related to the formal Implementation Plan which are too large for the list server will be announced on the list server and posted on the Surface Observing Program Web Site: **http://www.nws.noaa.gov/ops2/Surface/index.htm**.

4. **Post-Implementation User Notification:** Upon notification of successful initiation of service by the AOMC, OPS22 will normally issue notification of the change and its impact to all affected users on a monthly basis until all scheduled sites have been implemented. **In the case of the Processor Board, since there is no functional change, no notification is required.**

5.0 POST- OI ACTIVITIES

The completion of the OI at each location marks the transition to post implementation activities. This chapter gives a comprehensive description of the post-OI activities. The sections in this chapter describe the post-implementation activities necessary to integrate the new Processor Board into routine ongoing operations, and identify the office(s) responsible. These activities include: Operational Quality Control, Documentation, Disposition of Old Equipment, and Climate Continuity Study. They begin immediately upon operational activation and are accomplished in parallel.

1. **Operational Quality Control:** The responsible WFO will continue with normal monitoring of the operation of the newly installed Processor Board beyond the initial 30-day detailed monitoring period. This will ensure proper ongoing operation of both the installed unit and the entire system. The WFO will perform maintenance on system components for which they are responsible. Any PPI parts returned to National Reconditioning Center (NRC) which are still under warranty will be reported by NRC (OPS16) to the PPI COTR, OPS11.

2. **Documentation:** Three operations are necessary to ensure proper documentation of changes to ASOS. They are:

   A) Data entry into the EMRS;
   B) Data entry into the CMIS, and;
   C) Data entry into the MIRS

   The EMRS *Form A-26* update is accomplished by the ET as part of the OI. *A sample Form A-26 is included as part of Appendix IV. The Regional EPM* will ensure the EMRS update is accomplished. The CMIS will be updated from new information in the EMRS. OPS13 will ensure this action is accomplished. The MIRS will be updated through the EMRS input to the CMIS. OPS 22 will ensure that the MIRS staff makes timely updates to the MIRS.

3. **Disposal of Old Equipment:** After the installation has been completed, package and ship the old equipment (CPUs and memory board) to the National Reconditioning Center in accordance with the Mod Note.

4. **Climate Continuity Study:** At a sub-set of implemented sites, a climate continuity study will be conducted to ensure no biases or meteorological discontinuities are introduced into the climate record which are not documented. **In the case of the Processor Board, there is no functional change and therefore no climate continuity study is required.**

APPENDIX I

ASOS Operational Implementation Check List

For

New Processor Board Upgrade

ASOS Planned Product Improvement

OI Check List - Part A

Planned Product Improvement:_____

Office completing this check list:_____ Date:_____

Item #	Item Description	OPR	Completion Date
2.1	**Pre- System Test (ST) Activities**		
1.	Submit RC for ST & obtain APMC approval to proceed	OST1	
2.	Prepare ST plan & draft outline for ST report	OPS24	
3.	Identify ST locations & dates	OPS24	
4.	Initiate procurement/delivery of PPI test units to ST sites	OST1	
5.	Deliver logistic supplies & test equipment to ST sites	OPS12	
6.	Provide draft MOD NOTES to ST sites	OPS12	
7.	Install PPI test units at ST sites	OPS12	
2.2	**ST Activities**		
1.	**Verify start date for ST**	**OPS22**	
2.	Complete ST data collection & analysis	OPS24	
3.	**Verify completion date for ST**	**OPS22**	
4.	Provide ST report to ACCB	OPS24	
2.3	**Pre-Operational Acceptance Test (OAT) Activities**		
1.	Submit RC to ACCB for OAT	OST1	
2.	OAT management decision by ACCB	OST1	
3.	Prepare OAT plan	OPS24	
4.	Determine OAT locations and schedule	OPS24	
5.	Initiate procurement/delivery of OAT units	OST1	

6.	Coordinate OAT logistics support	OPS12	
7.	Coordinate OAT maintenance support	OPS12	
8a.	OAT Documentation: Deliver MOD NOTES to OAT sites	OPS12	
8b.	OAT Documentation: Deliver OAT procedures to OAT sites	OPS24	
8c.	OAT Documentation: Deliver draft Release Notes to OAT sites	OPS22	
2.4 OAT Activities			
1.	**Verify start date for OAT**	**OPS22**	
2.	Complete OAT data collection and analysis	OPS24	
3.	Verify efficacy of draft OI plan	OPS24	
4.	**Verify completion date for OAT**	**OPS22**	
5.	Provide OAT report to ACCB	OPS24	
3.1 Pre- Operational Implementation (OI) Planning Activities			
1.	Prepare RC for OI	OST1	
2.	Production and acquisition management decision by APMC	OPS2	
3.	Prepare OI plan	OPS22	
4.	Identify OI locations	OPS22	
5.	Develop OI draw rate/installation sequence strategy	OPS22	
3.2 Pre-OI Logistic Support Activities			
1.	Initiate procurement/delivery of OI production units to NLSC	OPS11	
2.	Initiate logistic support process for OI production units	OPS12	
3.	Coordinate installation & maintenance of OI production units	OPS12	
3.3 Pre-OI Operational Support Activities			
1a.	Provide MOD NOTES to WFOs	OPS12	
1b.	Provide Release Notes to WFOs	OPS22	
1c.	Provide updates of appropriate WSOM chapters to WFOs	OS7	NA
1d.	Provide updates of ASOS Users' Guide and other appropriate user information materials to WFOs, FAA, DOD	OPS22	NA

2a.	Provide maintenance training materials to WFOs	OPS22	NA
2b.	Provide observer training materials to WFOs	OPS12	NA
2c.	Conduct local operator/maintenance training	WFOs	NA
3.	Provide pre-implementation user notification	OPS22	NA
4.	**Verify completion of all pre-OI activities**	OPS22	
4.2	**Acquisition Activities**		
1 .	**Verify start date for Operational Implementation (OI)**	**OPS22**	
2.	Monitor & validate delivery of all production units to NLSC	OPS11	
3.	Stock production units and spare kits at NLSC	OPS14	
4.4	**OI Monitoring & Coordination Activities**		
2.a	Begin routine maintenance monitoring	AOMC	
3.a	Begin monitoring and reporting implementation status for all sites	AOMC	
3.b	Begin monitoring implementation status reports and initiate coordination	OPS22	
4.	Issue post-implementation notification to affected users	OPS22	NA

ASOS Planned Product Improvement
Operational Implementation (OI) Check List - Part B

Planned Product Improvement:_____

Location (SID, Name, State):_____

Office completing this check list:_____ Date:_____

Item #	Item Description	OPR	Completion Date
4.2	**Acquisition Activities**		
4.	Requisition PPI production units and kits from NLSC as needed	WFO	
4.3	**OI Installation Activities**		
1.	Download files for NCDC archive	WFO	
2.	Perform installation & checkout in accordance with MOD NOTE	WFO	
4.4	**OI Monitoring & Coordination Activities**		
1.	Installation notification	WFO	
2.b	Begin 30-day monitoring & coordination	WFO	
2.c	Begin 30-day monitoring & coordination	RFP	
2.d	Begin 30-day monitoring & coordination	AOMC	
5.0	**Post OI Activities**		
1.	Operational quality control: Monitor ongoing meteorological performance	WFO	
2a.	Ensure system changes are documented through EMRS	WFO	
2b.	Ensure new EMRS data are documented in the CMIS	OPS13	
2c.	Ensure CMIS documentation changes are entered into MIRS	OPS22	
3.	Dispose of old equipment in accordance with Mod Note	WFO	
4.	Conduct climate continuity study at selected locations (Begin 1-2 year study)	OS7	NA

APPENDIX II

ASOS Site Configuration List

For

New Processor Board Upgrade

OAT Sites for Processor Board

These are the WFOs responsible for the Processor Board OAT sites:

OAT Site		Responsible WFO
1V4	St. Johnsbury, VT	Burlington, VT
CLE	Cleveland, OH	Cleveland, OH
DCA*	Washington, DC	Sterling, VA
GFL *	Glens Falls, NY	Albany, NY
GSP	Greer, SC	Greer, SC
PWM *	Portland, ME	Gray, ME
BIS *	Bismarck, ND	Bismarck, ND
CNK*	Concordia, KS	Topeka, KS
CYS	Cheyenne, WY	Cheyenne, WY
EYE	Eagle Creek, IN	Indianapolis, IN
MDW*	Chicago, IL	Romeoville, IL
TQE	Tekamah, NE	Omaha, NE
ASD	Slidell, LA	Slidell, LA
ATT	Austin, TX	New Braunfels, TX
BNA	Nashville, TN	Old Hickory, TN
BVE	Boothville, LA	Slidell, LA
CSM *	Clinton, OK	Norman, OK
DFW	Dallas-Ft. Worth, TX	Fort Worth, TX
GDP	Guadalupe Pass, TX	Midland, TX
GUY*	Guymon, OK	Amarillo, TX
MEM	Memphis, TN	Memphis, TN
MIA*	Miami, FL	Miami, FL
MOB*	Mobile, AL	Mobile, AL
SSI	Brunswick, GA	Jacksonville, FL
VRB	Vero Beach, FL	Melbourne, FL
AST*	Astoria, OR	Portland, OR
BOI *	Boise, ID	Boise, ID
CZZ *	Campo, CA	San Diego, CA
PHX *	Phoenix, AZ	Phoenix, AZ
SFO *	San Francisco, CA	Monterey, CA
SLC *	Salt Lake City, UT	Salt Lake City, UT
SNT *	Stanley, ID	Pocatello, ID
UAO	Aurora, OR	Portland, OR
PABR *	Barrow, AK	Barrow, AK

PAFA *	Fairbanks, AK	Fairbanks, AK
PHTO *	Hilo, HI	Hilo, HI

Note: * = Also Dew Point OAT & Dew Point Climate Continuity Sites
