

## Lab Session 5, Experiment 4 Chemical Nomenclature

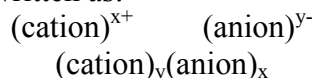

### Objective:

To learn how to read and write formulas of compounds

### Background:

Many of the substances you will encounter in this laboratory are ionic compounds. They are made up of ions which have an unequal number of protons and electrons. Ion is a charged species. If an element loses an electron, is it called a cation resulting in a positive charge. If an element gains an electron, is it called an anion resulting in a negative charge. Atoms of metals usually lose electrons. Atoms of nonmetals typically gain electrons. A polyatomic ion is a group of atoms that are bonded together and have an unequal number of protons and electrons.

Ionic compound names are read by stating the name of the cation, followed by the name of the anion. The formulas are written as:

**The subscripts (x and y) are the smallest possible whole numbers that would make the total charge equal to zero.** If a subscript is 1, it is omitted. If the ion is a polyatomic ion and the subscript is not one, then parentheses are placed around the polyatomic ion's formula before writing the subscript. The charges of the ions are not included in the formula of the compound. The charge of the ion is only written when the formula of the ion is written by itself.

There are two situations of naming inorganic compounds.

- Group A metal and a nonmetal: group A metals are simple ions
  1. Just name the cation as its elemental name.
  2. Just name the anion, changing the ending to -ide.
- Group B metal and a nonmetal: group B metals have changing charges
  1. Determine charge on the cation
  2. Name the cation
  3. Place roman numeral after the cation to indicate its charge

+1 = I  
+2 = II  
+3 = III  
+4 = IV  
+5 = V  
+6 = VI  
+7 = VII  
+8 = VIII  
+9 = IX  
+10 = X

4. Name the anion with an -ide ending.

$\text{FeCl}_2 \rightarrow$  iron (II) chloride

$\text{FeCl}_3 \rightarrow$  iron (III) chloride

$\text{SnO}_2 \rightarrow$  tin (IV) oxide

$\text{SnO} \rightarrow$  tin (II) oxide

- With a polyatomic:
  1. With a group A metal: name the cation ion, and then name the polyatomic
  2. With a group B metal: determine the charge, name the cation, use a roman numeral, and then name the polyatomic
  3. With a polyatomic cation: name the cation, name the nonmetal anion with -ide ending
  4. With two polyatomics: just name each of them in order

Example: Ions:  $\text{Ca}^{2+}$  and  $\text{Cl}^{1-}$

Formula:  $\text{CaCl}_2$

Name: Calcium chloride

Example: Ions:  $\text{NH}_4^+$  and  $\text{SO}_4^{2-}$

Formula:  $(\text{NH}_4)_2\text{SO}_4$

Name: Ammonium sulfate

Compounds composed of two nonmetals usually are not ionic, but covalent. Therefore, there are no ions, only atoms bonding together. Formulas of compounds such as these are written so that the subscripts (x and y) are whole numbers. If not specified, a subscript of 1 is implied. Use the following rules for naming binary compounds:

1. If MORE than one atom of the first element is present in the formula, state the prefix corresponding to that number. Do not use a prefix if there is only one atom present.
2. State the name of the first element.
3. Always state the prefix corresponding to the subscript of the second element (mono for one).
4. State the name of the root of the second element followed by the suffix -ide.
5. The following list includes the prefixes corresponding to the number of an element's atoms present in the formula.

mono = 1

hexa = 6

tetra = 4

nona = 9

di = 2

hepta = 7

penta = 5

deca = 10

tri = 3

octa = 8

Example: Formula:  $\text{OF}_2$

Name: Oxygen difluoride

Example: Formula:  $\text{P}_2\text{O}_5$

Name: diphosphorous pentoxide

Example: Formula:  $\text{CO}$

Name: carbon monoxide

List of polyatomic ions:

$\text{OH}^-$	Hydroxide
$\text{NH}_4^+$	Ammonium
$\text{NO}_3^-$	Nitrate
$\text{NO}_2^-$	Nitrite
$\text{ClO}_4^-$	Perchlorate
$\text{ClO}_3^-$	Chlorate
$\text{ClO}_2^-$	Chlorite
$\text{ClO}^-$	Hypochlorite
$\text{CO}_3^{2-}$	Carbonate
$\text{HCO}_3^-$	Hydrogen carbonate (or bicarbonate)
$\text{CN}^-$	Cyanide
$\text{C}_2\text{H}_3\text{O}_2^-$ (or $\text{CH}_3\text{COO}^-$ )	Acetate
$\text{SO}_4^{2-}$	Sulfate

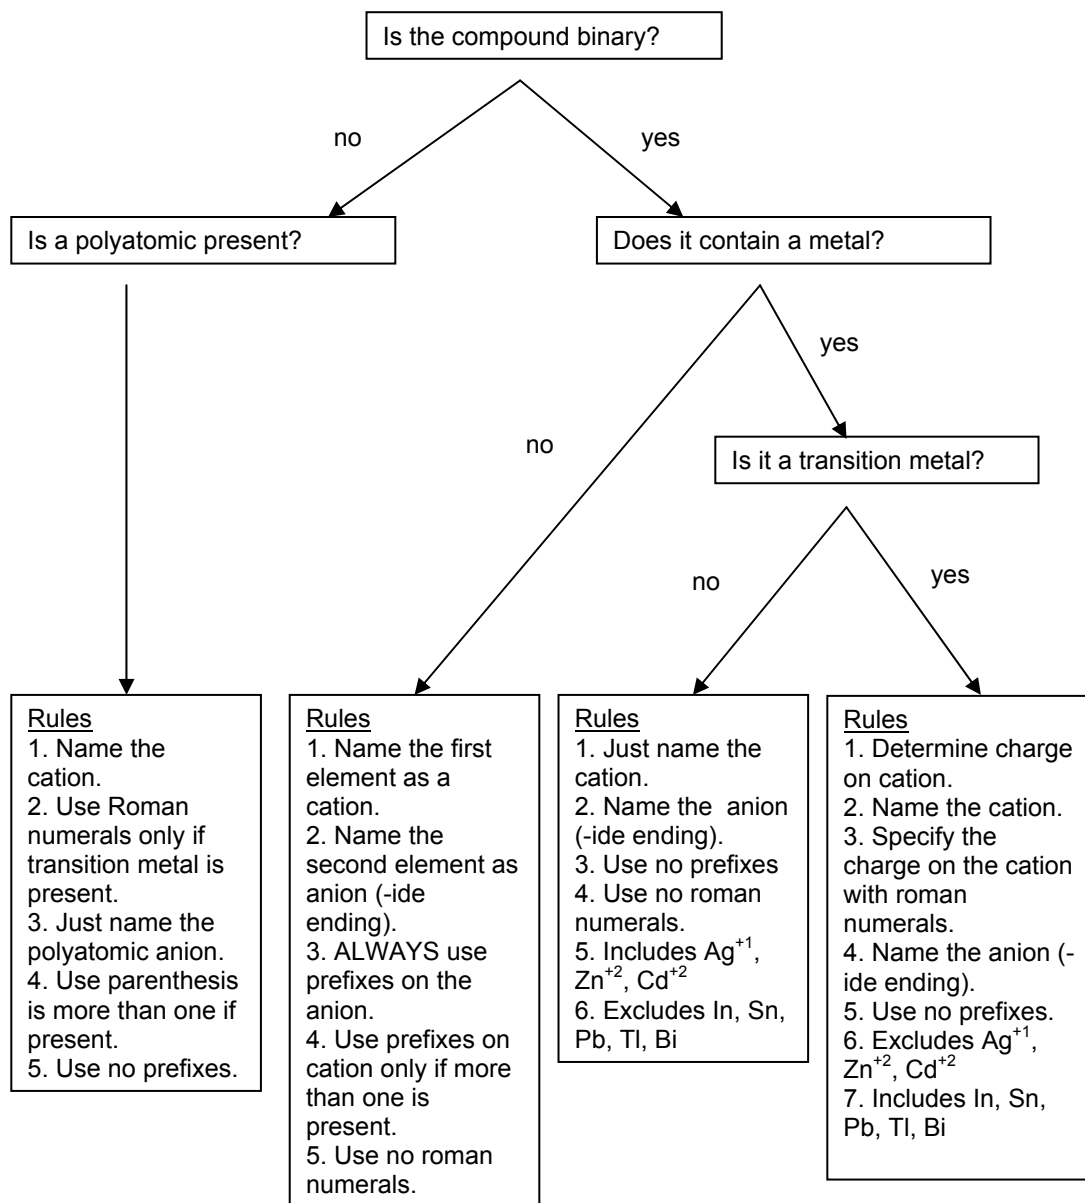

$\text{SO}_3^{2-}$	Sulfite
$\text{HSO}_4^-$	Hydrogen sulfate (or bisulfate)
$\text{HSO}_3^-$	Hydrogen sulfite (or bisulfite)
$\text{PO}_4^{3-}$	Phosphate
$\text{HPO}_4^{2-}$	Hydrogen phosphate
$\text{H}_2\text{PO}_4^-$	Dihydrogen phosphate
$\text{PO}_3^{3-}$	Phosphite
$\text{MnO}_4^-$	Permanganate
$\text{CrO}_4^{2-}$	Chromate
$\text{C}_2\text{O}_4^{2-}$	Oxalate
$\text{Cr}_2\text{O}_7^{2-}$	Dichromate
$\text{Hg}_2^{+2}$	Mercury (I)

### **Experimental procedure:**

1. Group 1A metal atoms tend to lose 1 electron and become a cation with a charge of 1+. Typically, so does silver (Ag). Write the formulas of the ions provided on the data summary sheet.
2. Group 2A metal atoms tend to lose 2 electrons and become a cation with a charge of 2+. Typically, so does zinc (Zn) and cadmium (Cd). Write the formulas of the ions provided on the data summary sheet.
3. Group 3A metal atoms tend to lose 3 electrons and become a cation with a charge of 3+. Write the formulas of the ions provided on the data summary sheet.
4. Transition metal atoms may lose a variable number of electrons, depending on the reaction condition. Also some of the larger representative metals can form more than one cation. If two or more charges are possible, it is necessary to specify the charge by using a roman numeral in parenthesis after stating the name of the cation. Write the formulas of the ions provided on the data summary sheet.
5. Atoms of the nonmetals in Group 7A (the halogens) tend to gain one electron and become anions with a charge of 1-. The name of an anion is composed of the root of the nonmetal's name and the suffix -ide. Write the formulas of the ions provided on the data summary sheet.
6. Atoms of nonmetals in Group 6A tend to gain two electrons and become anions with a charge of 2-. The name of the anions is composed of the root of the nonmetal's name and the end with a suffix of -ide. Write the formulas of the ions provided on the data summary sheet.

7. On the answer sheet write the correct formula for the ionic compounds.
8. On the answer sheet write the name of the ionic compounds. For the compounds containing metals that can form more than one cation, be sure to include roman numerals.
9. On the answer sheet name the binary compounds composed of nonmetals.
10. On the answer sheet write down the correct formula for the binary compounds composed of nonmetals.

### DATA SUMMARY SHEET CHEMICAL NOMENCLATURE

#### Cations:

- |                  |       |                    |       |
|------------------|-------|--------------------|-------|
| a) Sodium ion    | _____ | l) Strontium ion   | _____ |
| b) Lithium ion   | _____ | m) Cadmium ion     | _____ |
| c) Potassium ion | _____ | n) Aluminum ion    | _____ |
| d) Cesium ion    | _____ | o) Iron (II) ion   | _____ |
| e) Rubidium ion  | _____ | p) Iron (III) ion  | _____ |
| f) Silver ion    | _____ | q) Tin (II) ion    | _____ |
| g) Magnesium ion | _____ | r) Tin (IV) ion    | _____ |
| h) Barium ion    | _____ | s) Copper (I) ion  | _____ |
| i) Beryllium ion | _____ | t) Copper (II) ion | _____ |
| j) Zinc ion      | _____ | u) Lead (II) ion   | _____ |
| k) Calcium ion   | _____ | v) Lead (IV) ion   | _____ |

#### Anions:

- |                 |       |                  |       |
|-----------------|-------|------------------|-------|
| a) Fluoride ion | _____ | e) Oxide ion     | _____ |
| b) Bromide ion  | _____ | f) Selenide ion  | _____ |
| c) Chloride ion | _____ | g) Sulfide ion   | _____ |
| d) Iodide ion   | _____ | h) Telluride ion | _____ |

Write the correct formula for the ionic compounds.

- a) Silver Selenide \_\_\_\_\_
- b) Tin (IV) hydroxide \_\_\_\_\_
- c) Potassium sulfate \_\_\_\_\_
- d) Lithium sulfate \_\_\_\_\_
- e) Ammonium sulfate \_\_\_\_\_
- f) Barium carbonate \_\_\_\_\_
- g) Magnesium carbonate \_\_\_\_\_
- h) Cobalt (II) bromide \_\_\_\_\_
- i) Sodium oxide \_\_\_\_\_
- j) Barium bromide \_\_\_\_\_
- k) Aluminum iodide \_\_\_\_\_
- l) Zinc chloride \_\_\_\_\_
- m) Silver phosphate \_\_\_\_\_
- n) Ammonium phosphate \_\_\_\_\_
- o) Cadmium fluoride \_\_\_\_\_
- p) Magnesium hydroxide \_\_\_\_\_
- q) Rubidium sulfate \_\_\_\_\_
- r) Lithium hydroxide \_\_\_\_\_
- s) Mercury (II) oxide \_\_\_\_\_
- t) Aluminum permanganate \_\_\_\_\_
- u) Zinc sulfate \_\_\_\_\_
- v) Lead (II) acetate \_\_\_\_\_

- a) Sodium chloride \_\_\_\_\_
- b) Magnesium chloride \_\_\_\_\_
- c) Mercury (II) nitrate \_\_\_\_\_
- d) Zinc nitrate \_\_\_\_\_
- e) Tin (IV) oxide \_\_\_\_\_
- f) Cobalt (II) hydroxide \_\_\_\_\_
- g) Ammonium sulfide \_\_\_\_\_
- h) Sodium bicarbonate \_\_\_\_\_
- i) Tin (II) phosphate \_\_\_\_\_
- j) Iron (II) sulfide \_\_\_\_\_
- k) Aluminum dichromate \_\_\_\_\_

Write the name of the ionic compounds. For the compounds containing metals that can form more than one cation, be sure to include roman numerals.

- a)  $K_2S$  \_\_\_\_\_
- b)  $CaCl_2$  \_\_\_\_\_
- c)  $Na_2CO_3$  \_\_\_\_\_
- d)  $Fe(NO_2)_3$  \_\_\_\_\_
- e)  $Fe(NO_3)_2$  \_\_\_\_\_
- f)  $Zn_3(PO_4)_2$  \_\_\_\_\_
- g)  $BaBr_2$  \_\_\_\_\_
- h)  $AgCl$  \_\_\_\_\_
- i)  $CaSO_4$  \_\_\_\_\_
- j)  $MgSO_3$  \_\_\_\_\_

- k)  $\text{Sn}_3(\text{PO}_4)_4$  \_\_\_\_\_
- l)  $\text{NaBr}$  \_\_\_\_\_
- m)  $\text{Na}_2\text{SO}_4$  \_\_\_\_\_
- n)  $\text{K}_3\text{PO}_3$  \_\_\_\_\_
- o)  $\text{Cu}(\text{NO}_3)_2$  \_\_\_\_\_

Name the covalent compounds composed of nonmetals.

- a)  $\text{CF}_4$  \_\_\_\_\_
- b)  $\text{P}_4\text{O}_{10}$  \_\_\_\_\_
- c)  $\text{SF}_6$  \_\_\_\_\_
- d)  $\text{S}_2\text{F}_2$  \_\_\_\_\_
- e)  $\text{SO}_3$  \_\_\_\_\_
- f)  $\text{PCl}_3$  \_\_\_\_\_
- g)  $\text{NO}$  \_\_\_\_\_

Write down the correct formula for the covalent compounds composed of nonmetals.

- a) Phosphorous pentachloride \_\_\_\_\_
- b) Carbon tetrachloride \_\_\_\_\_
- c) Carbon dioxide \_\_\_\_\_
- d) Dinitrogen trioxide \_\_\_\_\_
- e) Dihydrogen monoxide \_\_\_\_\_
- f) Another name for dihydrogen monoxide is: \_\_\_\_\_
