Pr	elab	#5-	-Halogens	Lab

Reading Assignment:

- 1. Description of experiment.
- 2. The Group 7A Elements—BLB, sec. 22.4, pp. 926-930
- 3. Periodic Properties—BLB, sec. 7.1-7.3, pp. 250-259.
- 4. Review Oxidation-Reduction Reactions—BLB, sec. 4.4, pp. 131-138.

Questions:

1. Make a list of all halogens and halide salts being used in this experiment giving proper names of each. Give the physical state (solid, liquid, or gas) in which the halogens are found at room temperature.

Halogen	Halide salt	Physical state of Halogens at room temperature

2. Write the balanced <i>net ionic equation</i> for the reaction of chlorine $(Cl_{2(aq)})$ with sodium
bromide (NaBr _(aq)) to form bromine (Br _{2(aq)}) and chloride ions ($Cl_{(aq)}$). In aqueous solution, NaBı
forms ions $Na^+_{(aq)}$ and $Br^{(aq)}$. Net ionic equation means that spectator ions (ions that do not
participate in the reaction and are the same on both sides of the reaction) are not included.

^{3.} The halogens and halides are members of the Group 17 (or Group 7a) elements and exhibit reactivities based on their position in the periodic table. The halogens and halides participate in reduction - oxidation (redox) reactions that involve the exchange of electrons. The upcoming experiment examines the ability of a given halogen to oxidize a given halide. Trends in the periodic table permit prediction of the outcome and also explain the reactivities as you go down a group. To gain knowledge on the tendencies of the group 17 elements visit the following website: www.chemguide.co.uk/inorganic/group7menu.html. Focus on the sections entitled: Atomic and Physical Properties and Halogens as Oxidizing Agents. Fill in the blanks in the following summary:

Prelab #5—Halogens Lab

Electronegativity:

is the most el	ectronegative atom.
Electronegativity	(<i>increases/decreases</i>) as you go down a Group.
more electronegative atom is	(<i>more/less</i>) likely to give up electrons to
other atoms.	
Because fluorine is	(<i>smaller/larger</i>) than chlorine, its
s closer to its neighboring atoms,	thus it exerts a stronger pull on its neighbor's
electrons. This is why fluorine is m	nore electronegative than chlorine.
ns as oxidizing/reducing agents:	
	reduction) is the loss of electrons.
(oxidation/	/reduction) is the loss of electrons. on from a chloride ion, we say that fluorine is helping
(<i>oxidation/</i> If a fluorine atom takes an electro	·
(<i>oxidation/</i> If a fluorine atom takes an electro	on from a chloride ion, we say that fluorine is helping (oxidized/reduced). Hence, fluorine is a(n)
(oxidation/ If a fluorine atom takes an electro the chloride ion to be(oxidizing/	on from a chloride ion, we say that fluorine is helping (oxidized/reduced). Hence, fluorine is a(n)
(oxidation/ If a fluorine atom takes an electro the chloride ion to be (oxidizing/ Chlorine has the ability to take ele	on from a chloride ion, we say that fluorine is helping(oxidized/reduced). Hence, fluorine is a(n) (reducing) agent.
(oxidation/ If a fluorine atom takes an electro the chloride ion to be(oxidizing/ Chlorine has the ability to take ele means that chlorine is a more powe	on from a chloride ion, we say that fluorine is helping (oxidized/reduced). Hence, fluorine is a(n) /reducing) agent. ectrons from both bromide ions and iodide ions. That erful(oxidizing/reducing)
(oxidation/ If a fluorine atom takes an electro the chloride ion to be (oxidizing/ Chlorine has the ability to take ele	on from a chloride ion, we say that fluorine is helping(oxidized/reduced). Hence, fluorine is a(n) (reducing) agent. ectrons from both bromide ions and iodide ions. That erful(oxidizing/reducing) he.
