12	Security Programming	419
13	Logging and Tracing	445
14	Interacting with the Operating System	459
15	Interprocess Communication	475
16	Parallel and Distributed Processing with RFCs	511

Contents

Int	ntroduction			
PAI	RTI	Appetizers		
1	Stri	ng Processing Techniques	27	
	1.1	ABAP Character Types	27	
	1.2	Designing a Custom String Library	29	
		1.2.1 Developing the API	29	
		1.2.2 Encapsulating Basic String Processing Statements	33	
	1.3	Improving Productivity with Regular Expressions	36	
		1.3.1 Understanding Regular Expressions	37	
		1.3.2 Regular Expression Syntax	37	
		1.3.3 Using Regular Expressions in ABAP	46	
		1.3.4 Integrating Regular Expression Support into the		
		String Library	53	
	1.4	Summary	56	
2	Wo	rking with Numbers, Dates, and Bytes	57	
	2.1	Numeric Operations	57	
		2.1.1 ABAP Math Functions	58	
		2.1.2 Generating Random Numbers	60	
	2.2	Date and Time Processing	64	
		2.2.1 Understanding ABAP Date and Time Types	64	
		2.2.2 Date and Time Calculations	65	
		2.2.3 Working with Timestamps	66	
		2.2.4 Calendar Operations	70	
	2.3	Bits and Bytes	73	
		2.3.1 Introduction to the Hexadecimal Type in ABAP	73	
		2.3.2 Reading and Writing Individual Bits	75	
		2.3.3 Bitwise Logical Operators	76	
	2.4	Summary	79	

3	Dyn	amic and Reflective Programming	81
	3.1	Working with Field Symbols	81 82
		3.1.2 Field Symbol Declarations	83
		3.1.3 Assigning Data Objects to Field Symbols	85
		3.1.4 Casting Data Objects During the Assignment Process	89
	3.2	Reference Data Objects	91
		3.2.1 Declaring Data Reference Variables	91
		3.2.2 Assigning References to Data Objects	93
		3.2.3 Dynamic Data Object Creation	94
		3.2.4 Performing Assignments Using Data Reference	
		Variables	96
		3.2.5 De-Referencing Data References	96
	3.3	Introspection with ABAP Run Time Type Services	98
		3.3.1 ABAP RTTS System Classes	99
		3.3.2 Working with Type Objects	100
		3.3.3 Defining Custom Data Types Dynamically	102
		3.3.4 Case Study: RTTS Usage in the ALV Object Model	104
	3.4	Dynamic Program Generation	106
		3.4.1 Creating a Subroutine Pool	106
		3.4.2 Creating a Report Program	107
		3.4.3 Drawbacks to Dynamic Program Generation	108
	3.5	Summary	108
4	ΔΒΔ	.P and Unicode	109
ı	71071	in and onload	105
	4.1	Introduction to Character Codes and Unicode	109
		4.1.1 Understanding Character-Encoding Systems	110
		4.1.2 Limitations of Early Character-Encoding Systems	111
		4.1.3 What Is Unicode?	111
		4.1.4 Unicode Support in SAP Systems	113
	4.2	Developing Unicode-Enabled Programs in ABAP	113
		4.2.1 Overview of Unicode-Related Changes to ABAP	114
		4.2.2 Thinking in Unicode	117
		4.2.3 Turning on Unicode Checks	120
	4.3	Working with Unicode System Classes	121

		4.3.2	Converting ABAP Data Objects into External Data Formats	124
		4.3.3	Converting Between External Formats	124
		4.3.4	Useful Character Utilities	129
	4.4		ary	131
	4.4	Summe	ary	151
PAI	RT II	Main (Courses	
5	Woi	rking w	vith Files	135
	5.1	File Pro	ocessing on the Application Server	135
		5.1.1	Understanding the ABAP File Interface	136
		5.1.2	Case Study: Processing Files with the ABAP File Interface	141
	5.2	Workir	ng with Unicode	148
		5.2.1	Changes to the OPEN DATASET Statement to	
			Support Unicode	149
		5.2.2	Using Class CL_ABAP_FILE_UTILITIES	149
	5.3	Logica	I Files and Directories	150
		5.3.1	Defining Logical Directory Paths and Files in	
			Transaction FILE	151
		5.3.2	Working with the Logical File API	155
	5.4	File Co	ompression with ZIP Archives	157
		5.4.1	The ABAP ZIP File API	158
		5.4.2	Creating a ZIP File	159
		5.4.3	Reading a ZIP File	163
	5.5	File Pro	ocessing on the Presentation Server	167
		5.5.1	Interacting with the SAP GUI via	
			CL_GUI_FRONTEND_SERVICES	167
		5.5.2	Downloading a File	168
		5.5.3	Uploading a File	171
	5.6		nitting Files Using FTP	173
		5.6.1	Introducing the SAPFTP Library	173
		5.6.2	Wrapping the SAPFTP Library in an ABAP Objects	
			Class	175
		5.6.3	Uploading and Downloading Files Using FTP	176
		5.6.4	Implementation Details	179
	5.7	Summa	ary	182

Converting External Data into ABAP Data Objects 121

4.3.1

6	Dat	abase I	Programming	183
	6.1	Object	t-Relational Mapping and Persistence	183
		6.1.1	Positioning of Object-Relational Mapping Tools	184
		6.1.2	Persistence Service Overview	184
		6.1.3	Mapping Concepts	187
	6.2	Develo	oping Persistent Classes	189
		6.2.1	Creating Persistent Classes in the Class Builder	190
		6.2.2	Defining Mappings Using the Mapping Assistant Tool	192
	6.3	Worki	ng with Persistent Objects	198
		6.3.1	Understanding the Class Agent API	199
		6.3.2	Performing Typical CRUD Operations	199
		6.3.3	Querying Persistent Objects with the Query Service	204
	6.4	Mode	ling Complex Relationships	206
		6.4.1	Defining Custom Attributes	207
		6.4.2	Filling in the Gaps	209
	6.5	Storing	g Text with Text Objects	214
		6.5.1	Defining Text Objects	214
		6.5.2	Using the Text Object API	218
		6.5.3	Alternatives to Working with Text Objects	222
	6.6	Conne	cting to External Databases	223
		6.6.1	Configuring a Database Connection	223
		6.6.2	Accessing the External Database	225
		6.6.3	Further Reading	230
	6.7	Summ	ary	231
7	Tran	sactio	nal Programming	233
	7.1	Introd	uction to the ACID Transaction Model	233
	7.2		ction Processing with SAP LUWs	235
		7.2.1	Introduction to SAP Logical Units of Work	235
		7.2.2	Bundling Database Changes in Update Function	
			Modules	239
		7.2.3	Bundling Database Changes in Subroutines	242
		7.2.4	Performing Local Updates	244
		7.2.5	Dealing with Exceptions in the Update Task	245
	7.3		ng with the Transaction Service	248
		7.3.1	Transaction Service Overview	248
		7.3.2	Understanding Transaction Modes	249

		7.5.5 Processing transactions in Object-Oriented Mode	200
		7.3.4 Performing Consistency Checks with Check Agents	259
	7.4	Implementing Locking with the Enqueue Service	262
		7.4.1 Introduction to the SAP Lock Concept	262
		7.4.2 Defining Lock Objects	263
		7.4.3 Programming with Locks	265
		7.4.4 Integration with the SAP Update System	267
		7.4.5 Lock Administration	267
	7.5	Tracking Changes with Change Documents	268
		7.5.1 What Are Change Documents?	269
		7.5.2 Creating Change Document Objects	269
		7.5.3 Configuring Change-Relevant Fields	273
		7.5.4 Programming with Change Documents	274
	7.6	Summary	279
	o=	Marila ta Ga	
PA	KI III	Meals to Go	
8	XML	Processing in ABAP	283
			202
	8.1	Introduction to XML	283
		8.1.1 What Is XML?	284
		8.1.2 XML Syntax	285
		8.1.3 Defining XML Documents Using XML Schema	289
	8.2	Parsing XML with the iXML Library	291
		8.2.1 Introducing the iXML Library API	291
		8.2.2 Working with DOM	292
		8.2.3 Case Study: Developing XML Mapping Programs	
		in ABAP	297
		8.2.4 Next Steps	304
	8.3	Transforming XML Using XSLT	304
		8.3.1 What Is XSLT?	305
		8.3.2 Anatomy of an XSLT Stylesheet	305
		8.3.3 Integrating XSLT with ABAP	308
		8.3.4 Creating XSLT Stylesheets	308
		8.3.5 Processing XSLT Programs in ABAP	310
		8.3.6 Case Study: Transforming Business Partners with XSLT	311
		8.3.7 Serialization of ABAP Data Objects Using asXML	314
	8.4	Simple Transformation	317
	0.4	Jilipie Halisiothiauoti	517

9.1 HTTP Overview 9.1.1 Working with the Uniform Interface 9.1.2 Addressability and URLs 9.1.3 Understanding the HTTP Message Format 9.2 Introduction to the ICF 9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer	ST	318 319 324 325 327
9.1.1 Working with the Uniform Interface 9.1.2 Addressability and URLs 9.1.3 Understanding the HTTP Message Format 9.2 Introduction to the ICF 9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3.1 Creating a Service Consumer		329
9.1.2 Addressability and URLs 9.1.3 Understanding the HTTP Message Format 9.2 Introduction to the ICF 9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		329
9.1.3 Understanding the HTTP Message Format 9.2 Introduction to the ICF 9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		330
9.2 Introduction to the ICF 9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3.1 Creating a Service Consumer		332
9.3 Developing an HTTP Client Program 9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3.1 Creating a Service Consumer		333
9.3.1 Defining the Service Call 9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		335
9.3.2 Working with the ICF Client API 9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3.1 Creating a Service Consumer		336
9.3.3 Putting It All Together 9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		337
9.4 Implementing ICF Handler Modules 9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		338
9.4.1 Working with the ICF Server-Side API 9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		340
9.4.2 Creating an ICF Service Node 9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		346
9.4.3 Developing an ICF Handler Class 9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		347
9.4.4 Testing the ICF Service Node 9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		348
9.5 Summary 10 Web Services 10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		354
10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		358
10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		360
10.1 Web Service Overview 10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		
10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		361
10.1.1 Introduction to SOAP 10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		361
10.1.2 Describing SOAP-Based Services with WSDL 10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services		362
10.1.3 Web Service Discovery with UDDI 10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		365
10.2 Providing Web Services 10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		365
10.2.1 Creating Service Definitions 10.2.2 Configuring Runtime Settings 10.2.3 Testing Service Providers 10.3 Consuming Web Services 10.3.1 Creating a Service Consumer		366

Although amateur cooks may hesitate to experiment with spices, accomplished chefs know how to use them to create the perfect dish. As an ABAP developer, the same can be said of certain data types. In this chapter, we show you how you can use some of these types to improve the quality of your programs.

2 Working with Numbers, Dates, and Bytes

One of the nice things about working with an advanced programming language like ABAP is that you don't often have to worry about how that data is represented behind the scenes at the bits and bytes level; the language does such a good job of abstracting data that it becomes irrelevant. However, if you do come across a requirement that compels you to dig a little deeper, you'll find that ABAP also has excellent support for performing more advanced operations with elementary data types. In this chapter, we investigate some of these operations and show you techniques for using these features in your programs.

2.1 Numeric Operations

Whether it's keeping up with a loop index or calculating entries in a balance sheet, almost every ABAP program works with numbers on some level. Typically, whenever we perform operations on these numbers, we use basic arithmetic operators such as the + (addition), - (subtraction), * (multiplication), or / (division) operators. Occasionally, we might use the MOD operator to calculate the remainder of an integer division operation, or the ** operator to calculate the value of a number raised to the power of another. However, sometimes we need to perform more advanced calculations. If you're a mathematics guru, then perhaps you could come up with an algorithm to perform these advanced calculations using the basic arithmetic operators available in ABAP. For the rest of us mere mortals, ABAP provides an extensive set of mathematics tools that can be used to simplify these requirements. In the next two sections, we'll examine these tools and see how to use them in your programs.

2.1.1 ABAP Math Functions

ABAP provides many built-in math functions that you can use to develop advanced mathematical formulas as listed in Table 2.1. In many cases, these functions can be called using any of the built-in numeric data types in ABAP (e.g., the I, F, and P data types). However, some of these functions require the precision of the floating point data type (see Table 2.1 for more details). Because ABAP supports implicit type conversion between numeric types, you can easily cast non-floating point types into floating point types for use within these functions.

Function	Supported Numeric Types	Description
abs	(A11)	Calculates the absolute value of the provided argument.
sign	(A11)	Determines the sign of the provided argument. If the sign is positive, the function returns 1; if it's negative, it returns -1; otherwise, it returns 0.
ceil	(All)	Calculates the smallest integer value that isn't smaller than the argument.
floor	(A11)	Calculates the largest integer value that isn't larger than the argument.
trunc	(A11)	Returns the integer part of the argument.
frac	(A11)	Returns the fractional part of the argument.
cos, sin, tan	F	Implements the basic trigonometric functions.
acos, asin, atan	F	Implements the inverse trigonometric functions.
cosh, sinh, tanh	F	Implements the hyperbolic trigonometric functions.
exp	F	Implements the exponential function with a base $e \approx 2.7182818285$.
log	F	Implements the natural logarithm function.
log10	F	Calculates a logarithm using base 10.
sqrt	F	Calculates the square root of a number.

Table 2.1 ABAP Math Functions

The report program ZMATHDEMO shown in Listing 2.1 contains examples of how to call the math functions listed in Table 2.1 in an ABAP program. The output of this program is displayed in Figure 2.1.

WRITE: / 'Square Root: ', lv_result.
```

Listing 2.1 Working with ABAP Math Functions

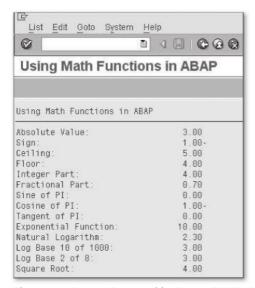

Figure 2.1 Output Generated by Report ZMATHDEMO

The values of the function calls can be used as operands in more complex expressions. For example, in Listing 2.1, notice how we're calculating the value of $\log(8)$. Here, we use the change of base formula $\log(x) / \log(b)$ (where b refers to the target base, and x refers to the value applied to the logarithm function) to derive the base 2 value. Collectively, these functions can be combined with typical math operators to devise some very complex mathematical formulas.

2.1.2 Generating Random Numbers

Computers live in a logical world where everything is supposed to make sense. Whereas this characteristic makes computers very good at automating many kinds

of tasks, it can also make it somewhat difficult to model certain real-world phenomena. Often, we need to simulate *imperfection* in some form or another. One common method for achieving this is to produce randomized data using random number generators. Random numbers are commonly used in statistics, cryptography, and many kinds of scientific applications. They are also used in algorithm design to implement *fairness* and to simulate useful metaphors applied to the study of artificial intelligence (e.g., genetic algorithms with randomized mutations, etc.).

SAP provides random number generators for all of the built-in numeric data types via a series of ABAP Objects classes. These classes begin with the prefix <code>CL_ABAP_RANDOM(e.g., CL_ABAP_RANDOM_FLOAT, CL_ABAP_RANDOM_INT, etc.)</code>. Though none of these classes inherit from the <code>CL_ABAP_RANDOM</code> base class, they do use its features behind the scenes using a common OO technique called *composition*. Composition basically implies that one class delegates certain functionality to an instance of another class. The UML class diagram shown in Figure 2.2 shows the basic structure of the provided random number generator classes.

```
CL_ABAP_RANDOM_*
+ CREATE ()
+ GET_NEXT()
```

Figure 2.2 Basic UML Class Diagram for Random Number Generators

Unlike most classes where you create an object using the CREATE OBJECT statement, instances of random number generators must be created via a call to a factory class method called CREATE(). The signature of the CREATE() method is shown in Figure 2.3. Here, you can see that the method defines an importing parameter called SEED that *seeds* the pseudo-random number generator algorithm that is used behind the scenes to generate the random numbers. In a pseudo-random number generator, random numbers are generated in sequence based on some calculation performed using the seed. Thus, a given seed value causes the random number generator to generate the same sequence of random numbers each time.

The CREATE() method for class CL_ABAP_RANDOM_INT also provides MIN and MAX parameters that can place limits around the random numbers that are generated (e.g., a range of 1-100, etc.). The returning PRNG parameter represents the generated random number generator instance. Once created, you can begin retrieving random numbers via a call to the GET_NEXT() instance method.

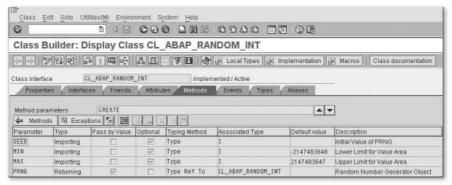

Figure 2.3 Signature of Class Method CREATE()

To demonstrate how these random number generator classes work, let's consider an example program. Listing 2.2 contains a simple report program named ZSCRAMBLER that defines a local class called LCL_SCRAMBLER. The LCL_SCRAMBLER class includes an instance method SCRAMBLE() that can be used to randomly scramble around the characters in a string. This primitive implementation creates a random number generator to produce random numbers in the range of [0... {String Length}]. Perhaps the most complex part of the implementation is related to the fact that random number generators produce some duplicates along the way. Therefore, we have to make sure that we haven't used the randomly generated number previously to make sure that each character in the original string is copied into the new one.

```

   CREATE OBJECT lo_scrambler.
   lv_scrambled = lo_scrambler->scramble( 'Andersen' ).
   WRITE: / lv_scrambled.
```

Listing 2.2 Using Random Number Generators in ABAP

Obviously, a simple scrambler routine like the one shown in Listing 2.2 isn't production quality. Nevertheless, it does give you a glimpse of how you can use random number generators to implement some interesting algorithms. As a reader exercise, you might think about how you could use random number generators to implement an UNSCRAMBLE() method to unscramble strings generated from calls to method SCRAMBLE().

2.2 Date and Time Processing

Online transaction processing (OLTP) systems such as the ones that make up the SAP Business Suite maintain quite a bit of time-sensitive data, so it's important that you understand how to work with the built-in date and time types provided in ABAP. In the following subsections, we discuss these types and explain how to use them to perform calculations and conversions.

2.2.1 Understanding ABAP Date and Time Types

ABAP provides two built-in types to work with dates and times: the D (date) data type and the T (time) data type. Both of these types are fixed-length character types that have the form YYYYMMDD and HHMMSS, respectively. In addition to these built-in types, the ABAP Dictionary types TIMESTAMP and TIMESTAMPL are being used more and more in many standard application tables, and so on, to store a timestamp in the UTC format. Table 2.2 shows the basic date and time types available in ABAP.

¹ The term "UTC" is an abbreviation for "Consolidated Universal Time," which is a time standard based on the International Atomic Time standard. UTC is roughly equivalent to the Greenwich Mean Time standard (or GMT) which refers to the mean solar time at the Royal Observatory in Greenwich, London. Collectively, these standards define a global time standard that can be used to convert a given time to local time, and vice versa.

Data Type	Description
D	A built-in fixed-length date type of the form YYYYMMDD. For example, the value 20100913 represents the date September 13, 2010.
Т	A built-in fixed-length time type of the form <code>HHMMSS</code> . For example, the value 102305 represents the time 10:23:05 AM.
TIMESTAMP (Type P - Length 8 No decimals)	An ABAP Dictionary type used to represent short timestamps in the form YYYYMMDDhhmmss. For example, the value 20100913102305 represents the date September 13, 2010 at 10:23:05 AM.
TIMESTAMPL (Type P - Length 11 Decimals 7)	An ABAP Dictionary type used to represent long timestamps in the form YYYYMMDDhhmmssmmuuun. The additional digits mmmuuun represent fractions of a second.

Table 2.2 ABAP Date and Time Data Types

2.2.2 Date and Time Calculations

When you're working with dates, you often need to perform various calculations to compute the difference between two dates, make comparisons, or determine a valid date range. As we mentioned in Section 2.2.1, Understanding ABAP Date and Time Types, the built-in date and time types in ABAP are *character types*, not numeric types. Nevertheless, the ABAP runtime environment allows you to perform basic numeric operations on these types by implicitly converting them to numeric types behind the scenes.

The code excerpt shown in Listing 2.3 demonstrates how these calculations work. Initially, the variable <code>lv_date</code> is assigned the value of the current system date (e.g., the system field <code>SY-DATUM</code>). Next, we increment that date value by 30. In terms of a date calculation in ABAP, this implies that we're increasing the *day* component of the date object by 30 days. Here, note that the ABAP runtime environment is smart enough to *roll over* the date value whenever it reaches the end of a month, and so on. In other words, you can rely on the system to ensure that you don't calculate an invalid date value (e.g., 01/43/2011).

```
DATA: lv_date TYPE d.
lv_date = sy-datum.
WRITE: / 'Current Date:', lv_date MM/DD/YYYY.
```

```
lv_date = lv_date + 30.
WRITE: / 'Future Date:', lv_date MM/DD/YYYY.
```

Listing 2.3 Performing Date Calculations in ABAP

Time calculations in ABAP work very similarly to the date calculations shown in Listing 2.3. With time calculations, the computation is based upon the *seconds* component of the time object. The code in Listing 2.4 shows how we can increment the current system time by 90 seconds using basic time arithmetic.

```
DATA: lv_time TYPE t.
lv_time = sy-uzeit.
WRITE /(60) lv_time USING EDIT MASK
    'The current time is __:__:__'.
lv_time = lv_time + 90.
WRITE /(60) lv_time USING EDIT MASK
    'A minute and a half from now it will be __:__'.
```

Listing 2.4 Performing Time Calculations in ABAP

In addition to typical numeric calculations, you also have the option of working with date/time fields using normal character-based semantics. For instance, you can use the offset/length functionality to initialize date or time components. The code excerpt in Listing 2.5 demonstrates how you can adjust the date 02/13/2003 to 01/13/2003 using offset/length semantics.

```
DATA: lv_date TYPE d VALUE '20030213'.

WRITE: / lv_date MM/DD/YYYY.

lv_date+4(2) = '01'.

WRITE: / lv_date MM/DD/YYYY.
```

Listing 2.5 Manipulating a Date Using Offset/Length Functionality

2.2.3 Working with Timestamps

If you've been working with some of the newer releases of the products in the SAP Business Suite, you may have encountered certain applications that use the TIMESTAMP or TIMESTAMPL data types to store time-sensitive data. As you can see in Table 2.2, these ABAP Dictionary types store timestamps with varying degrees of accuracy. Interestingly, though these types aren't built-in types like D or T, ABAP does provide some native support for them in the form of a couple of built-in statements. In addition, SAP also provides a system class called CL_ABAP_TSTMP, which can be used to simplify the process of working with timestamps. We investigate these features in the following subsections.

Retrieving the Current Timestamp

You can retrieve the current system time and store it in a timestamp variable using the GET TIME STAMP statement whose syntax is demonstrated in Listing 2.6. The GET TIME STAMP statement stores the timestamp in a shorthand or longhand format depending upon the type of the timestamp data object used after the FIELD addition. The timestamp value is encoded using the UTC standard.

Listing 2.6 Using the GET TIME STAMP Statement

Looking at the code excerpt in Listing 2.6, you can see that we're displaying the timestamp using the TIME ZONE addition of the WRITE statement. This addition formats the output of the timestamp according to the rules for the time zone specified. In Listing 2.6, we used the system field SY-ZONLO to display the *local time zone* configured in the user's preferences. However, we could have just as easily used a data object of type TIMEZONE, or even a hard-coded literal such as 'CST'.

Time Zones

For a complete list of time zones configured in the system, have a look at the contents of ABAP Dictionary Table TTZZ.

Converting Timestamps

You can convert a timestamp to a date/time data object and vice versa using the CONVERT statement in ABAP. Listing 2.7 shows the syntax used to convert a timestamp into data objects of type D and T. The TIME ZONE addition adjusts the UTC date/time value within the timestamp in accordance with a particular time zone. Additionally, the optional DAYLIGHT SAVING TIME addition can be used to determine whether or not the timestamp value happens to coincide with daylight savings time. If it does, the Tv_dst variable has the value 'X'; otherwise, it's blank.

This feature can be helpful in differentiating between timestamp values that lie within the transitional period between summer time and winter time.²

```
CONVERT TIME STAMP lv_tstamp TIME ZONE lv_tzone
   INTO [ DATE lv_date ] [ TIME lv_time ]
   [DAYLIGHT SAVING TIME lv_dst].
```

Listing 2.7 Syntax of CONVERT TIME STAMP Statement

Listing 2.8 shows how the CONVERT TIME STAMP statement is used to convert the current system timestamp to date/time data objects using the local time zone.

```
TYPE-POOLS: abap.
DATA: lv_tstamp TYPE timestamp,
      lv_date TYPE d,
      lv_time TYPE t,
     lv_dst TYPE abap_bool.
GET TIME STAMP FIELD lv_tstamp.
CONVERT TIME STAMP lv_tstamp TIME ZONE sy-zonlo
   INTO DATE lv_date TIME lv_time
   DAYLIGHT SAVING TIME lv_dst.
WRITE: / 'Today's date is: ', lv_date MM/DD/YYYY.
WRITE: /(60) lv_time USING EDIT MASK
             'The current time is: __:__'.
IF lv_dst EQ abap_true.
 WRITE: / 'In daylight savings time...'.
 WRITE: / 'Not in daylight savings time...'.
ENDIF.
```

Listing 2.8 Converting Timestamps to Date/Time Objects

To create a timestamp using a date/time object, you can use the syntax variant of the CONVERT statement shown in Listing 2.9. The date/time values are qualified using the TIME ZONE addition so that the appropriate offsets can be applied as the UTC timestamp is generated.

² For a complete list of daylight savings time rules, have a look at the contents of the ABAP Dictionary table TTZDV.

```
CONVERT DATE lv_date

[TIME lv_time [DAYLIGHT SAVING TIME lv_dst]]

INTO TIME STAMP lv_tstamp TIME ZONE lv_tzone.
```

Listing 2.9 Syntax of CONVERT DATE Statement

The code excerpt in Listing 2.10 shows how the CONVERT DATE statement can be used to generate a timestamp object from a date/time object.

```
CL_ABAP_TSTMP

+ ADD()
+ SUBTRACT()
+ SUBTRACTSECS()
+ TD_ADD()
+ TD_SUBTRACT()
+ ISDOUBLEINTERVAL()
+ SYSTEMTSTMP_SYST2LOC()
+ SYSTEMTSTMP_LOC2SYST()
+ SYSTEMTSTMP_UC2SYST()
+ SYSTEMTSTMP_UC2SYST()
+ SYSTEMTSTMP_SYST2UTC()
+ TD_NORMALIZE()
+ NORMALIZE()
```

Figure 2.4 UML Class Diagram for Class CL_ABAP_TSTMP

Timestamp Operations Using System Class CL_ABAP_TSTMP

Unlike the native D and T types, the ABAP runtime environment doesn't have built-in functionality to perform calculations on timestamps (e.g., add or subtract, etc.). Instead, SAP provides a system class called CL_ABAP_TSTMP for this purpose. Figure 2.4 contains a UML class diagram that shows the publicly available methods provided in this class. As you would expect, there are various forms of ADD() and

SUBTRACT() methods to perform timestamp calculations. In addition, a series of conversion methods (e.g., SYSTEMTSTMP_SYST2LOC(), etc.) can be used to convert a timestamp to various time zones, a Boolean method called ISDOUBLEINTERVAL() can be used to determine if a timestamp is in daylight savings time, and a couple of methods can be used to *normalize* a timestamp. Here, normalization implies that an invalid time value such as 10:30:60 would be adjusted to the value 10:31:00.

In UML class diagram notation, methods that are underlined are defined as *class methods*. Class methods can be invoked without first creating an instance of the class in which they are defined, as evidenced in the code excerpt shown in Listing 2.11. Here, we're using the class method ADD() to add 75 seconds to the current system time.

```
DATA: lv_tstamp TYPE timestamp,
      lv_date TYPE d.
      lv_time TYPE t.
GET TIME STAMP FIELD 1v_tstamp.
WRITE: / 'Time Stamp Value:', lv_tstamp TIME ZONE sy-zonlo.
TRY.
  CALL METHOD cl_abap_tstmp=>add
    EXPORTING
      tstmp = lv_tstamp
     secs = 75
    RECEIVING
      r_tstmp = lv_tstamp.
CATCH CX_PARAMETER_INVALID_RANGE.
CATCH CX_PARAMETER_INVALID_TYPE.
ENDTRY.
WRITE: / 'Time Stamp Value:', lv_tstamp TIME ZONE sy-zonlo.
Listing 2.11 Working with Timestamps Using CL_ABAP_TSTMP
```

The call signatures of most of the other methods in class <code>CL_ABAP_TSTMP</code> are similar to the <code>ADD()</code> method demonstrated in Listing 2.11. For more details concerning the functionality of particular methods in this class, see the class/method documentation for this class in the Class Builder (Transaction SE24).

2.2.4 Calendar Operations

So far, our discussion on dates has focused on raw calculations and conversions.

However, many typical use cases in the business world require that we look at dates from a semantic point of view. For example, you might ask whether or not the date 1/13/2010 is a working day, or whether 4/4/2010 is a holiday. The answers to these kinds of questions require the use of a *calendar*. Fortunately, SAP provides a very robust set of calendaring features straight out of the box with SAP NetWeaver AS ABAP.

The SAP Calendar is maintained in a client-specific manner inside the SAP Customizing implementation guide (Transaction SPRO). Depending on how your system is set up, you might have a project-specific implementation guide. However, for the purposes of this discussion, we assume that you're using the default SAP Reference Implementation Guide (IMG). You can access this guide by clicking on the button labeled SAP Reference IMG on the initial screen of Transaction SPRO (see Figure 2.5).

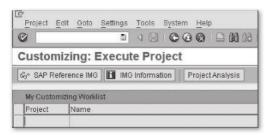

Figure 2.5 Initial Screen of Transaction SPRO

Inside the SAP Reference IMG, you can find the SAP Calendar under the navigation path SAP NETWEAVER • GENERAL SETTINGS • MAINTAIN CALENDAR (see Figure 2.6).

Figure 2.6 Navigating to the SAP Calendar in the IMG

Figure 2.7 shows the main menu of the SAP Calendar transaction. From here, you can configure subobjects such as public holidays, holiday calendars, and factory calendars. By default, an SAP NetWeaver system comes preconfigured with some typical settings in these subareas. However, you're also free to create customized holidays and calendars as needed.

Figure 2.7 Maintaining the SAP Calendar in the IMG

After the SAP Calendar is configured properly, you can use this data to perform various types of calculations. Table 2.3 shows some useful function modules that leverage this data to determine whether or not a given date is a working day, holiday, and so on. You can find out more information about these function modules in the documentation provided for each module in the Function Builder (Transaction SE37).

Function Name	Description
DATE_COMPUTE_DAY	Computes the day of the week for a given date. Day values are calculated as 1 (Monday), 2 (Tuesday), and so on.
DATE_COMPUTE_DAY_ENHANCED	Computes the day of the week just like DATE_COMPUTE_DAY; also returns the day value as text (e.g., TUESDAY, etc.).

Table 2.3 Useful Date Functions in Function Group SCAL

Function Name	Description
DATE_CONVERT_TO_FACTORYDATE	Calculates the factory date value for a given date. Also provides an indicator that confirms whether or not the given date is considered a working day according to the selected factory calendar.
DATE_GET_WEEK	Determines the week of the year for the given date. For example, the date 9/13/2010 would be the 37th week of the year 2010.
FACTORYDATE_CONVERT_TO_DATE	Converts a factory date value back into a date object.
HOLIDAY_CHECK_AND_GET_INFO	Tests to determine whether or not a given date is a holiday based on the configured holiday calendar.
WEEK_GET_FIRST_DAY	Calculates the first day of a given week.

Table 2.3 Useful Date Functions in Function Group SCAL (Cont.)

2.3 Bits and Bytes

Modern programming languages do such a tremendous job of abstracting the complexities of computer architectures that, these days, we seldom have any need to work at the bits and bytes level. However, with the advent of Unicode, it's becoming more important to understand how to work at this level because many external data sources encode their data using multi-byte encodings — as opposed to the single-byte code pages normally used in ABAP (e.g., ASCII, etc.). In addition, knowledge of this area can be quite handy in other applications, as you'll see in a moment.

2.3.1 Introduction to the Hexadecimal Type in ABAP

Normally, whenever we talk about the built-in native data types provided in the ABAP programming language, we focus our attention around the numeric and character data types. However, ABAP also provides a hexadecimal data type (X) that is used to represent individual bytes in memory. The values stored in the individual bytes are represented as two-digit hexadecimal numbers.

Binary and Hexadecimal Numbers

If you have never worked with binary or hexadecimal numbers before, then a brief introduction is in order. A *byte* is a unit of measure for memory inside of a computer. Each byte is comprised of 8 bits. The term *bit* is an abbreviation for *binary digit*. A bit can have one of two logical values: 1 (or true) or 0 (or false). In terms of computer circuitry, bits that have the value 1 are turned *on*, while those that have the value 0 are turned *off*.

The binary (or base-2) number system represents numeric values using binary digits. Figure 2.8 shows an example of an 8-bit binary number whose decimal value is 170. As you can see, reading from right to left, the value of each bit is calculated by multiplying one or zero (i.e., the bit value) by two raised to the power of the current index (where indexes start at zero).

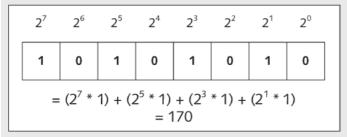

Figure 2.8 Example of an 8-Bit Binary Number

Binary numbers can be very difficult to work with if you're not a computer. Therefore, the values of bytes are often represented using the hexadecimal (or base-16) numbering system. Each hexadecimal digit is in the range [0123456789ABCDEF], where A = 10, B = 11, C = 12, and so on. Conveniently, each hexadecimal digit can hold any possible value of 4 bits (commonly called a *nibble*). Therefore, two hexadecimal digits can be used to represent a single byte of information in memory.

In addition to the fixed length X data type, ABAP also provides the XSTRING variable-length hexadecimal type, which is commonly used in various input/output (I/O) operations. Here, as is the case with the C and STRING data types described in Chapter 1, String Processing Techniques, there is a trade-off between performance and flexibility.

Now that you know a little bit about the hexadecimal type, let's take a look at the types of operations you can perform on data objects of this type. The following sections describe the built-in bitwise operators available in ABAP.

2.3.2 Reading and Writing Individual Bits

You can use the GET BIT and SET BIT statements to read and write individual bits of a hexadecimal data object. The general syntax of these statements is shown in Listing 2.12 and Listing 2.13, respectively.

```
GET BIT lv_index OF lv_hex INTO lv_bit.

Listing 2.12 Syntax of GET BIT Statement

SET BIT lv_index OF lv_hex TO lv_bit.

Listing 2.13 Syntax of SET BIT Statement
```

To demonstrate how these statements work, let's consider an example. Listing 2.14 contains a contrived piece of sample code that swaps the first byte of a two-byte hexadecimal data object with the last byte by manipulating individual bits internally. For good measure, we also shift the bits around one more time at the end of the code snippet, using the SHIFT statement in *byte mode*.

```
TYPE x VALUE 'FOOF',
DATA: 1v_hex(2)
     lv_front_idx TYPE i,
     lv_back_idx TYPE i,
     lv_front_bit TYPE i,
     lv_back_bit TYPE i.
WRITE: / lv_hex.
DO 8 TIMES.
 lv_front_idx = sy-index.
 lv\_back\_idx = lv\_front\_idx + 8.
  GET BIT lv_front_idx OF lv_hex INTO lv_front_bit.
  GET BIT lv_back_idx OF lv_hex INTO lv_back_bit.
  SET BIT lv_front_idx OF lv_hex TO lv_back_bit.
  SET BIT lv_back_idx OF lv_hex TO lv_front_bit.
ENDDO.
WRITE: / lv_hex.
SHIFT lv_hex BY 1 PLACES CIRCULAR IN BYTE MODE.
WRITE: / lv_hex.
```

Listing 2.14 Reading and Writing Bits in ABAP

In and of itself, low-level bit manipulation isn't all that exciting. However, there are situations where it can be quite useful.

For example, let's imagine you're working on a problem where you need to work with arbitrarily large numbers that exceed the limits of the built-in ABAP numeric types. One way other modern programming languages, such as Java or .NET, get around this limitation is by developing a so-called numeric wrapper class. For instance, the <code>java.math.BigInteger</code> class provided with the Java 2 SDK is used to represent arbitrarily large integer values. Internally, bitwise operators are used to mimic the behavior of a normal primitive type represented in two's complement notation. Because this implementation is open source, it wouldn't be too difficult to reverse-engineer an ABAP version of this class to suit your purposes.

2.3.3 Bitwise Logical Operators

In addition to the GET BIT and SET BIT statements, ABAP also provides a series of bitwise logical operators that can be used to build Boolean algebraic expressions. If you aren't familiar with Boolean algebra, there are many excellent resources available online — simply search for the term "Boolean Algebra," and you'll find a wealth of information. Of course, even if you have worked with Boolean operators before, you might need a bit of a refresher. Table 2.4 depicts a *truth table* that shows the values generated when applying the Boolean AND, OR, or XOR operators against the two bit values contained in Field A and Field B.

Field A	Field B	AND	OR	XOR
0	0	0	0	0
0	1	0	1	1
1	0	0	1	1
1	1	1	1	0

Table 2.4 Truth Table for Boolean Operators

Table 2.5 shows the bitwise operators provided with the ABAP language. Just like normal arithmetic operators, the bitwise operators can be combined in complex expressions using parentheses, and so on.

³ The two's complement notation is a common system used to represent signed integers in computers.

Bitwise Operator	Description
BIT-NOT	Unary operator that flips all of the bits in the hexadecimal number to the opposite value. For example, applying this operator to a hexadecimal number having the bit-level value 10101010 (e.g., 'AA') would yield 01010101.
BIT-AND	Binary operator that compares each field bit-by-bit using the Boolean AND operator.
BIT-XOR	Binary operator that compares each field bit-by-bit using the Boolean XOR (or eXclusive OR) operator.
BIT-OR	Binary operator that compares each field bit-by-bit using the Boolean OR operator.

Table 2.5 Bitwise Logical Operators in ABAP

To see the power of bitwise operators such as the ones listed in Table 2.5, it's useful to consider an example. Imagine that you are tasked with building a custom document management system. One of the requirements of this system is to be able to assign rights permissions to the individual documents maintained in the system. For the purposes of this simple example, let's assume that the possible permissions are *Create*, *Remove*, *Update*, and *Display*.

One way to store these assignments might be to create a database table that contained a series of *flag* columns to indicate whether or not a user had a particular permission for a given document. Unfortunately, there are a couple of problems with this approach. First of all, it requires that we create separate fields for each possible permission type. As the system grows, additional permission types require a modification to the database table. This phenomenon leads into the second problem — namely, space. In other words, each additional flag column adds another byte or two of storage to every row in the table. Of course, another option is to capture the permissions in separate rows. Still, either way you slice it, this can get expensive from a storage perspective.

Instead of creating a new flag column each time we want to add a new permission type to our system, what if we could figure out a way to store a bunch of Boolean flags in a single field? Naturally, the hexadecimal data type lends itself well to this kind of storage operation because it can be used as a type of *bit mask* to represent a large number of flags at the bit level. For example, a single byte bit mask could represent up to 28, or 256, possible values, leaving us plenty of room to grow. The

values of the individual Boolean flags can then be set using bitwise operators. Collectively, the process of representing a series of flags at the bit level and manipulating those flags using bitwise operators is referred to as *bit masking*.

The code excerpt in Listing 2.15 demonstrates how bit masking works using the ABAP bitwise logical operators. To keep things simple, we've created an interface that contains constants to represent the possible permission values (e.g., CO_CRE-ATE, etc.). These permission values are assigned to a display-only user using the BIT-OR operator, which effectively works like an addition operator in this case. We can then confirm whether or not the user has a given permission by applying the BIT-AND operator. Here, the result matches the permission constant bit-for-bit if the particular permission has been assigned. This can be confirmed by using the equality operator in an IF statement. In the example, the user has *Display* permissions but not *Create* permissions.

```
INTERFACE lif_permissions.
 CONSTANTS: CO_CREATE TYPE x VALUE '01',
            CO_REMOVE TYPE x VALUE '02',
             CO_UPDATE TYPE x VALUE '04',
             CO_DISPLAY TYPE x VALUE '08'.
ENDINTERFACE.
DATA: lv_display_user TYPE x,
     lv_permission TYPE x.
* Assign read-only access to a display user:
lv_display_user =
 lv_display_user BIT-OR lif_permissions=>CO_DISPLAY.
* Check the user's permissions:
lv_permission =
 lv_display_user BIT-AND lif_permissions=>CO_DISPLAY.
IF lv_permission EQ lif_permissions=>CO_DISPLAY.
 WRITE: / 'User has display only access.'.
ELSE.
 WRITE: / 'User does not have display access.'.
ENDIF.
lv_permission =
 lv_display_user BIT-AND lif_permissions=>CO_CREATE.
IF lv_permission EQ lif_permissions=>CO_CREATE.
 WRITE: / 'User can create documents.'.
```

```
ELSE. \label{eq:write:write} \mbox{WRITE: / 'User is not authorized to create documents.'.} \\ \mbox{ENDIF.}
```

Listing 2.15 Mapping Permissions Using Bit Masking

As you can see, bit masking can be used as an effective compression technique. Other practical examples of bit masking include the storage of user preferences and set operations, which are described in an example in the online SAP Help Portal.

2.4 Summary

In this chapter, you learned about some advanced and perhaps lesser-known features of elementary data types in ABAP. During the course of this book, you'll see how some of these fundamental concepts provide the foundation for implementing new features in SAP NetWeaverAS ABAP, such as support for Unicode and XML processing. In the next chapter, we mix things up a bit and take a look at dynamic programming in ABAP.

REST Representational State Transfer, 336	SAP List Viewer, 104 ALV, 104
RESTful Web Services, 336, 361 RFC interface, 511	ALV Object Model, 104 Dynamic creation of field catalog, 104
RFCs, 511 Asynchronous call, 515 Example, 513 Finding, 514 Overview, 512 Variants, 512	Field catalog, 104 SAP Lock Concept, 262 Integration with the SAP update system, 267 Introduction, 262 Lock administration, 267
RFC server group, 518 Example, 519 Maintaining in Transaction RZ12, 519	SAP LUW, 235, 250 Bundling changes in subroutines, 242 Defined, 238
Roles, 423	Introduction, 235 Local updates, 244
ROLLBACK WORK statement, 238 RTTS, 99	Update function modules, 239
Class CL_ABAP_TABLEDESCR, 100 Class CL_ABAP_TYPEDESCR, 99 Class hierarchy, 99 Common uses, 106 Creating a custom elementary type, 102	SAP MaxDB, 225 SAP NetWeaver AS ABAP, 236 As a preemptive multitasking system, 236 Basic architecture, 236 Context switching, 238
Creating a Custom Structure Type, 102	Update work process, 238

SAP NetWeaver AS ABAP authorization	Maintaining in Transaction PFCG, 430
concept, 419, 422	Service consumer
Authorization, 423	ABAP proxy class, 383, 388
Authorization object, 423	Binding to a WSDL file, 381
Authorization profile, 423	Design-time repository object, 383
Authorizations, 430	Editing in the Object Navigator, 383
Overview, 423	Example, 389
Roles, 423	Logical port, 383
Summary, 434	Selecting a prefix, 381
SAP NetWeaver AS ABAP memory	Usage scenario in ABAP, 386
organization, 476	Viewing an ABAP proxy class, 389
Illustration, 476	Service definition, 367
Local memory, 476	Assigning to a transport request, 370
Shared memory, 476	Configuring runtime settings, 373
SAP NetWeaver Process Integration, 297	Creating with the Service Wizard, 367
Description, 297	Deploying, 370
SAP PI, 297	Editing an endpoint, 375
SAPscript text object	Editing in the Object Navigator, 372
Text header, 218	Name mapping, 370
SAPscript text object instances	Service-oriented architecture, 361
Creating, 218	SOA, 361
Deleting, 222	Service provider
Reading, 221	Authentication, 375
Updating, 221	Downloading a WSDL file, 373
SAPscript text objects, 214	Testing, 376
Alternatives, 222	Transport guarantee, 375
API, 218	Service Wizard
Defining, 214, 218	Accessing in the Object Navigator, 367
Text IDs, 214	SET DATASET statement
Secure Network Communications	Syntax, 146
SNC, 421	SET UPDATE TASK LOCAL statement,
Security model, 419	244
Key elements, 420	Shared memory, 475
Security programming, 419	Extended memory buffer, 477
Authentication, 420	Paging buffer, 477
Authorization, 420	Roll buffer, 477
Design points, 422	SAP buffer, 477
Developing a security model, 419	Shared memory area, 486
Encryption, 421	Area handle, 487
Least privilege principle, 422	Area instance versioning, 507
Performing authorization checks, 433	Automatic area structuring, 502
Virus scans, 437	Basic properties, 490
Security roles, 430	Defined, 487

Defining in Transaction SHMA, 486	<tt< th=""></tt<>
Dynamic properties, 493	attribute> command, 327
Fixed properties, 493	cond> command, 322
Monitoring in Transaction SHMM, 509	cond-var> command, 322
Naming conventions, 489	deserialize> command, 323
Runtime settings, 494	group> command, 323
Shared memory area instance	loop> command, 323, 327
Versioning, 487	serialize> command, 323
Shared memory areas	skip> command, 322
Defining, 489	switch> command, 322
Shared memory objects, 486	switch-var> command, 322
Abstracting the API, 505	value> command, 320
API usage, 495	Usage example, 325
Architecture, 486	SOA, 361, 365
Area class, 486	Web Services, 361
Area root class, 486	SOAP, 362
Locking concepts, 506	Comparison to legacy protocols, 362
Read lock, 506	Defined, 362
Shared memory area, 486	HTTP, 363
UML class diagram of base	Introduction, 362
components, 486	Language independence, 362
Update lock, 506	Message flow, 364
Write lock, 506	Message structure, 363
Simple API for XML, 291	Platform independence, 362
SAX, 291	Service Description Language, 365
Simple Mail Transfer Protocol, 395	Transport layer protocol, 363
Defined, 395	Using SMTP, 415
SMTP, 395	XML message format, 362
Simple object access protocol, 362	soapUI, 376
SOAP, 362	Building a SOAP request, 377
Simple Transformation, 317, 409	Configuring basic authentication, 377
ABAP data binding, 319	Running a test, 378
Addressing data roots, 321	SPLIT statement, 43
Basic syntax, 325	SQL, 183
Creating ST programs, 324	String processing techniques, 27
Data roots, 320	Built-in statements, 29
Defined, 318	String testing, 445
Deserialization, 318	Structure component de-referencing
Flow control commands, 322	operator, 97
Main template, 318	Structure component selector operator,
Serialization, 318	87
