

**Targeted Break-in, DoS,  
& Malware attacks (I)**

(February 18, 2015)

© Abdou Illia – Spring 2015

---

---

---

---

---

---

---

---

**Learning Objectives**

- Understand Targeted attacks' preparation
- Discuss Break-in attacks

2

---

---

---

---

---

---

---

---

**Targeted attacks' preparation**

- Before launching targeted attacks, attackers engage in:
  - Unobtrusive info gathering
  - Host scanning
  - Port scanning
  - Network scanning
  - Fingerprinting

3

---

---

---

---

---

---

---

---

## Unobtrusive Information Collection

- Sending packets into a network is “noisy”
- Need to do unobtrusive info gathering, first, by
  - Visiting target corporate website for
    - Employees' names and emails
    - Officers names and organizational structure, etc.
  - Reading trade press (often online & searchable) for
    - Info about products under development
    - Firms' financial prospects, etc.
  - Searching U.S. EDGAR\* system online for
    - Ownership, shareholder information, etc.
  - Searching the Whois database at:
    - [NetworkSolutions.com/whois/index.jsp](http://NetworkSolutions.com/whois/index.jsp), [internic.net/whois.html](http://internic.net/whois.html), etc.

4

\* Electronic Data Gathering, Analysis, and Retrieval

---

---

---

---

---

---

---

---

---

## Sample of Whois entries

- **Domain Name: PUKANUI.COM**  
**Administrative Contact :**  
**Panko, Ray Ray@Panko.com**  
**1456 KALANIKI ST HONOLULU, HI 96821 US**  
**Phone: (808) 377-1149**
- **Domain servers in listed order:**  
**[NS75.WORLDNIC.COM](http://NS75.WORLDNIC.COM) [205.178.190.38](http://205.178.190.38)**  
**[NS76.WORLDNIC.COM](http://NS76.WORLDNIC.COM) [205.178.189.38](http://205.178.189.38)**

DNS Servers

IP Address Locator: <http://www.geobytes.com/lplocator.htm>

Display email headers in Gmail, Yahoo!, Hotmail: <http://aruljohn.com/info/howtofindipaddress/>

6

---

---

---

---

---

---

---

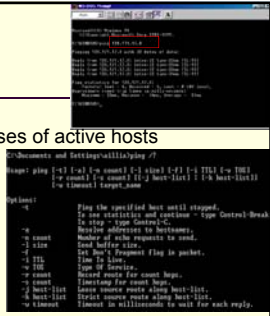

---

---

---

## Host Scanning

- Objective: identify IP addresses of active hosts
- Pinging individual hosts
- Ping scanning
  - Pinging a range of IP addresses
  - IP scanning software: fping, gping, **Ping Sweep**, Pinger
- SYN/ACK scanning used when firewall configured to block pinging from outside

7

---

---

---

---

---

---

---

---

## Network Scanning

- Objective: understand a network internal structure including routers, firewalls location
- Also called network mapping
- Main tools used
  - Tracert (in Windows) or Traceroute (in Linux)
  - Network scanning software, e.g **NetScanner**

8

---

---

---

---

---

---

---

---

## Port Scanning

- Port Scanning
    - Most break-ins exploit specific services/applications
- | Service | Default Port |
|---------|--------------|
| www     | 80           |
| FTP     | 21           |
| SMTP    | 25           |
- Scan target for open ports
    - Send SYN segments to a particular port number
    - Observe SYN/ACK or reset (RST) responses

9

---

---

---

---

---

---

---

---

## Fingerprinting

- Determining specific software run by target
  - Identify a particular operating system or application program and (if possible) version
    - For example, Microsoft Windows 2000 Server
    - For example, BSD LINUX 4.2
    - For example, Microsoft IIS 5.0
  - Useful because most exploits are specific to particular programs or versions

10

---

---

---

---

---

---

---

---

## Active vs. Passive fingerprinting

- Active Fingerprinting
  - Send odd messages and observe replies
  - Different operating systems and application programs respond differently
  - Active fingerprinting may set off alarms
    - Attackers usually use rate of attack messages below IDSs volume thresholds
- Passive Fingerprinting
  - Read headers (IP-H, TCP-H, etc.) of normal response messages
    - e.g. Windows 2000 uses TTL = 128 and Window Size = 18000
  - Passive Fingerprint difficult b/c Admin could change default values

Time To Live (8 bits)	Protocol (8 bits) 1=ICMP, 6=TCP, 17=UDP	Window Size (16 bits)
--------------------------	--	--------------------------

11

---

---

---

---

---

---

---

---

## Fingerprinting by reading banners

- Many programs have preset banners used in initiating communications
- Using telnet or FTP to connect to a server could display the banner

```
Details:
220-----
220-This is the "Banner" message for the Mac OS X Server's FTP server process.
220-
220-      FTP clients will receive this message immediately
220-      before being prompted for a name and password.
220-
220-PLEASE NOTE:
220-      Some FTP clients may exhibit problems if you make this file too long.
220-
220-----
220
220 battery.eiu.edu FTP server ready.
530 Guest login disabled.
```

12

---

---

---

---

---

---

---

---

## Summary Questions 1

- In preparing his attack, the attacker used the **ping** command to determine whether or not the target computers are connected and responsive. Which of the following did the attacker do?
  - a) Network scanning
  - b) Port scanning
  - c) None of the above

13

---

---

---

---

---

---

---

---

## Summary Questions 1 (cont.)

- In preparing his attack, the attacker sent normal HTTP requests to a web server. Then, he spent some time analyzing the protocol-related information in the response received from the web server in order to determine what software are installed on the web server. Which of the following did the attacker do?
  - a) Active learning
  - b) Network scanning
  - c) Passive fingerprinting
  - d) None of the above

14

---

---

---

---

---

---

---

---

## Break-In Attacks

- Take advantage of known vulnerabilities that have not been patched
  - Exploits are easy to use
  - Frequently effective
- Intruder needs
  - User names and passwords, *or*
  - Hijack another user's session

15

---

---

---

---

---

---

---

---

## Obtaining passwords

- By using social engineering
- By intercepting authentication communications
- With physical access
  - Can install keystroke capture programs
  - Can copy password file and crack it later by password “guessing”
    - Windows 2000, XP: \windows\system32\config
    - Linux: /etc/passwd

16

---

---

---

---

---

---

---

---

## Password guessing

- Brute force
  - Generating possible password combinations by changing one character at a time
    - If password is 4 decimal numbers
      - Start with 0000; next try 0001; then 0002; etc.
      - How many possible combinations? \_\_\_\_\_
    - If password is 6 alphabetical characters, how many possible combinations? \_\_\_\_\_
  - Brute force password cracking software available

17

---

---

---

---

---

---

---

---

## Password guessing (cont.)

- Dictionary attack
  - Does **not** try all possible combinations
  - Takes each word from a “dictionary”, then
    - Encodes it in the same way the target computer encodes passwords
    - Compares encoded word with password file entries

18

---

---

---

---

---

---

---

---

## Summary Questions 2

- You want to crack the passwords in the SAM file on a Windows XP computer. The Operating system is installed on the C: drive. At what specific location is the SAM file located?
  - a) C:\
  - b) C:\root
  - c) C:\Windows\system32
  - d) C:\Windows\system32\config

19

---

---

---

---

---

---

---

---

## Summary Questions 2 (cont.)

- Assume that a password is 2 decimal number long. What is the maximum number of passwords that an attacker would have to try in order to crack the password?
  - a) 4
  - b) 67108864
  - c) 1024
  - d) None of the above
- How much time (in minutes) will it take to crack the password if it requires 1.2 second to try each password?

**Answer:** a maximum of \_\_\_\_\_ minutes.

20

---

---

---

---

---

---

---

---

## Session Hijacking

- Exploiting of a valid communication session to gain unauthorized access
- Many servers use session IDs to continue communication with returned users
- Session could be hijacked using
  - Session sniffing

---

---

---

---

---

---

---

---

## Session Hijacking (cont.)

- Session Hijacking could also be done through
  - Theft of session cookie file used for authenticating users by web servers

```
POST http://example.com/submit.php HTTP/1.1
Host: example.com
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.2; en-US; rv:1.8.1.6) Gecko/20070715 Firefox/2.0.0.4 Panel2 2.1
Accept: text/html,application/xhtml+xml,application/javascript;q=0.9,*/*;q=0.8
Accept-Language: en-us,en;q=0.5
Accept-Charset: ISO-8859-1,utf-8;q=0.7;q=0.3
Keep-Alive: 300
Proxy-Connection: keep-alive
Referer: http://example.com/submit.php
Cookie: JSESSIONID=833154E7D0B4788F1DB3EC11838888
Authorization: Basic Zm9yb2p1c2Vpb3Q=
Content-Type: application/x-www-form-urlencoded
Content-Length: 81
```

22

---

---

---

---

---

---

---

---

---

## Break-In: Posthack

- Install rootkit for posthack activities
  - Usually downloaded through trivial file transfer protocol (TFTP)
- Create backdoors for reentry if original hacking vulnerability is fixed
  - Backdoor accounts
  - Trojanized programs that permit reentry
- Collect needed info or damage the system
- Weaken system's security
- Delete audit logs

23

---

---

---

---

---

---

---

---

---
