CONDITIONS FOR ACCEPTING THIRD PARTY INSPECTIONS

The following quote is from the North Carolina State Building Code Volume 1A. Section 3.6.2 Concrete Inspections:

3.6.2 Concrete Inspections. During the construction of large or complicated building designs involving concrete pours, the code enforcement official may authorize an inspection agency or individual to inspect the following:

1. The excavation of soil and/or the forming of footings with and the associated placement of reinforcing steel prior to the pouring of concrete;
2. The forming of floors, columns, beams, and other structural members including the placement of reinforcing steel prior to the pouring of concrete.

The inspection agency or individual must be a professional engineer or a registered architect in the State of North Carolina. To utilize this procedure, the responsible contractor must continue to schedule all inspections normally required for this work by the local authority. This inspection agency or individual process is to be used only in the event that the code enforcement official cannot be present to make the inspection prior to the pouring of concrete. It shall be the responsibility of the inspection agency or individual to provide weekly reports to the Inspections Department bearing the seal of the responsible official that the placement of the related construction elements complies with the approved drawings and specifications. Any change from these permit documents must be approved by the code enforcement official prior to the inclusion of such within the construction. Failure to secure such approval may result in the removal of the element involved.

In the event that the inspection agency or individual is to be dismissed from the project, the owners or the contractor must notify the Inspections Department two (2) weeks in advance of the date of such dismissal. No further concrete pours are to be made without the required inspections by the local code enforcement official.
