

Web Publication Date: April 2013
Expiration Date: April 2018

Chemical Name: Tris – (1,3 – dichlorisopropyl) phosphate

CAS: 13674-87-8

Synonyms: Tris(1,3-dichloro-2-propyl)phosphate; Tri[2-chloro-1-(chloromethyl)ethyl] phosphate;
Fyrol FR 2; TDCPP; TDCP

Acute Non-Cancer Health Based Value (nHBV_{Acute}) = Not Derived (Insufficient Data)

Short-term Non-Cancer Health Based Value (nHBV_{Short-term}) = Not Derived (Insufficient Data)

Subchronic Non-Cancer Health Based Value (nHBV_{Subchronic}) = 20 ug/L

$$= \frac{(\text{Reference Dose, mg/kg/d}) \times (\text{Relative Source Contribution}) \times (\text{Conversion Factor})}{(\text{Subchronic intake rate, L/kg-d})}$$

$$= \frac{(0.0067 \text{ mg/kg/d}) \times (0.2) \times (1000 \text{ ug/mg})}{(0.077 \text{ L/kg-d})}$$

$$= 17 \text{ rounded to } \mathbf{20 \text{ ug/L}}$$

Reference Dose/Concentration: 0.0067 mg/kg-d (mice)

Source of toxicity value: MDH, 2013

Point of Departure: 15 mg/kg-d (NOAEL from 3 month dietary study by Kamata et al 1989)

Human Equivalent Dose (MDH, 2011): 15 x 0.13 = 2.0 mg/kg-d (MDH 2011)

Total uncertainty factor: 300

Uncertainty factor allocation: 3 for interspecies differences (for toxicodynamics), 10 for intraspecies variability, and 10 for database uncertainty (to address no or inadequate information regarding developmental/reproductive function, neurological, immune and endocrine effects)

Critical effect(s): Increased liver and kidney weights

Co-critical effect(s): None

Additivity endpoint(s): Hepatic (liver) system, Renal (kidney) system

Chronic Non-Cancer Health Based Value (nHBV_{Chronic}) = 9 ug/L

$$\begin{aligned} &= \frac{(\text{Reference Dose, mg/kg/d}) \times (\text{Relative Source Contribution}) \times (\text{Conversion Factor})}{(\text{Chronic intake rate, L/kg-d})} \\ &= \frac{(0.0019 \text{ mg/kg/d}) \times (0.2) \times (1000 \text{ ug/mg})}{(0.043 \text{ L/kg-d})} \\ &= 8.8 \text{ rounded to } \mathbf{9 \text{ ug/L}} \end{aligned}$$

Reference Dose/Concentration: 0.0019 mg/kg-d (rats)
Source of toxicity value: MDH, 2013
Point of Departure: 1.94 mg/kg-d (BMDL_{10%} calculated by ATSDR 2012 based on renal tubule epithelial hyperplasia reported in Bio/dynamics 1981)
Human Equivalent Dose (MDH, 2011): 1.94 x 0.29 = 0.56 mg/kg-d (MDH 2011)
Total uncertainty factor: 300
Uncertainty factor allocation: 3 for interspecies differences (for toxicodynamics), 10 for intraspecies variability, and 10 for database uncertainty (to address no or inadequate information regarding developmental/reproductive function, neurological, immune and endocrine effects)
Critical effect(s): Renal tubule epithelial hyperplasia and seminal vesicle atrophy
Co-critical effect(s): None
Additivity endpoint(s): Renal (kidney) system; Male reproductive system

Cancer Health Based Value (cHBV) = 0.8 ug/L

$$\begin{aligned} &= \frac{(\text{Additional Lifetime Cancer Risk}) \times (\text{Conversion Factor})}{[(\text{SF} \times \text{ADAF}_{<2 \text{ yr}} \times \text{IR}_{<2 \text{ yr}} \times 2) + (\text{SF} \times \text{ADAF}_{2-16 \text{ yr}} \times \text{IR}_{2-16 \text{ yr}} \times 14) + (\text{SF} \times \text{ADAF}_{16+ \text{ yr}} \times \text{IR}_{16+ \text{ yr}} \times 54)] / 70} \\ &= \frac{(1\text{E-}5) \times (1000 \text{ ug/mg})}{[(0.13 \times 10 \times 0.137 \text{ L/kg-d} \times 2) + (0.13 \times 3 \times 0.047 \text{ L/kg-d} \times 14) + (0.13 \times 1 \times 0.039 \text{ L/kg-d} \times 54)] / 70} \\ &= 0.79 \text{ rounded to } \mathbf{0.8 \text{ ug/L}} \end{aligned}$$

Cancer classification: Has not been classified by US EPA
Probable human carcinogen (Consumer Product Safety Commission 2006)
Identified under Proposition 65 as a chemical known to cause

cancer (CalEPA 2012)
 Slope factor: 0.13 per mg/kg-d (2 year dietary study in rats, Freudenthal and Henrich 2000)
 Source of slope factor: CalEPA 2012
 Tumor site(s): Liver, kidney and testes

Volatile: No

Summary of Guidance Value History:

No previous guidance values for TDCPP. HBVs above represent new guidance values.

Summary of toxicity testing for health effects identified in the Health Standards Statute:

	Endocrine	Immunotoxicity	Development	Reproductive	Neurotoxicity
Tested?	Yes	Yes	Yes	Yes	Yes
Effects?	Yes ¹	Yes ²	Yes ³	Yes ⁴	Yes ⁵

Note: Even if testing for a specific health effect was not conducted for this chemical, information about that effect might be available from studies conducted for other purposes. Most chemicals have been subject to multiple studies in which researchers identify a dose where no effects were observed, and the lowest dose that caused one or more effects. A toxicity value based on the effect observed at the lowest dose across all available studies is considered protective of all other effects that occur at higher doses.

Comments on extent of testing or effects:

- ¹ A recent epidemiological study reported significant associations between serum prolactin and free T4 levels and TDCPP levels in household dust. However, study limitations preclude drawing conclusions from these observations. Oral toxicity studies in laboratory animals have mainly been limited to organ weights and histological assessments. Chronic exposure resulted in effects on male reproductive organs and increased thyroid weights at higher doses (> 2,600-fold higher than the chronic RfD). Hormonal measurements, however, were not taken. Studies conducted *in vitro* and in zebrafish demonstrate that TDCPP affects steroidogenesis, acts as an estrogen receptor antagonist and alters thyroid hormone concentrations. A database uncertainty factor has been incorporated into the derivation of the RfD to address the inadequate dataset regarding endocrine activity.
- ² Oral studies of immunological effects have been limited to measurements of thymus and spleen organ weights which do not appear to be sensitive endpoints. However, a 4 day subcutaneous injection study reported changes in immune function. In addition immune effects have been observed following exposure to other triphosphate flame retardants. A database uncertainty factor has been incorporated into the derivation of the RfD to address the inadequate oral toxicity dataset regarding immunological assessment.
- ³ Oral mammalian developmental studies are limited. No multigeneration studies have been conducted. Two developmental studies reported increased incidence of fetal death as dose levels resulting in maternal toxicity. These dose levels were more than 3000-fold higher than the subchronic and chronic RfDs.
- ⁴ Male reproductive organ effects were observed at the lowest dose tested in a 2 year dietary study in rats. These effects, in part, form the basis of the chronic RfD. Oral studies regarding functional

reproductive effects are limited. No multigeneration studies have been conducted. Female reproductive effects have not been adequately assessed. Effects on male reproductive ability were not observed in a 12 week study in rabbits. A database uncertainty factor has been incorporated into the derivation of the RfD to address the inadequate dataset regarding reproductive toxicity.

⁵ Oral studies regarding neurotoxicity are limited. A 2 year dietary study did not report clinical signs or morphological changes in the brain. Changes in red blood cell cholinesterase were measured but were inconsistent throughout the study. No developmental neurobehavioral effects were reported following *in utero* exposure but data reporting in that particular study were limited. Studies on other structurally related chemicals suggest the need for additional studies. A database uncertainty factor has been incorporated into the derivation of the RfD to address the inadequate dataset regarding neurological assessment.
