Chapter 4 Arrangement of Electrons in Atoms

Table of Contents

Section 1 The Development of a New Atomic Model

Section 2 The Quantum Model of the Atom

Section 3 Electron Configurations

Chapter 4 Section 1 The Development of a New Atomic Model

Properties of Light, continued

- Wavelength (λ) is the distance between corresponding points on adjacent waves.
- Frequency (v) is defined as the number of waves that pass a given point in a specific time, usually one second.

Chapter 4

Section 1 The Development of a New Atomic Model

Objectives

- Explain the mathematical relationship among the speed, wavelength, and frequency of electromagnetic radiation.
- · Discuss the dual wave-particle nature of light.
- Discuss the significance of the photoelectric effect and the line-emission spectrum of hydrogen to the development of the atomic model.
- · Describe the Bohr model of the hydrogen atom.

Chapter 4 A

Section 1 The Development of a New Atomic Model

Properties of Light, continued

 Frequency and wavelength are mathematically related to each other:

 $c = \lambda v$

 In the equation, c is the speed of light (in m/s), λ is the wavelength of the electromagnetic wave (in m), and v is the frequency of the electromagnetic wave (in s⁻¹).

Section 1 The Development of a New Atomic Model

Properties of Light

The Wave Description of Light

- Electromagnetic radiation is a form of energy that exhibits wavelike behavior as it travels through space.
- Together, all the forms of electromagnetic radiation form the electromagnetic spectrum.

Chapter 4 Section 1 The Development of a New Atomic Model

The Photoelectric Effect

• The **photoelectric effect** refers to the emission of electrons from a metal when light shines on the metal.

The Particle Description of Light

• A quantum of energy is the minimum quantity of energy that can be lost or gained by an atom.

Chapter 4 Atomic Model
The Photoelectric Effect, *continued*
The Particle Description of Light, *continued*
Chapter 4 German physicist Max Planck proposed the following
relationship between a quantum of energy and the frequency
of radiation:

$$E = hv$$

• *E* is the energy, in joules, of a quantum of radiation, v is
the frequency, in s⁻¹, of the radiation emitted, and *h* is a
fundamental physical constant now known as Planck's
constant; *h* = 6.626 × 10⁻³⁴ J• s.

Section 1 The Development of a New

Chapter 4 Section 1 The Development of a New Atomic Model

The Hydrogen-Atom Line-Emission Spectrum, continued

- When investigators passed electric current through a vacuum tube containing hydrogen gas at low pressure, they observed the emission of a characteristic pinkish glow.
- When a narrow beam of the emitted light was shined through a prism, it was separated into four specific colors of the visible spectrum.
- The four bands of light were part of what is known as hydrogen's **line-emission spectrum.**

Section 1 The Development of a New Chapter 4 Atomic Model

The Photoelectric Effect, continued

The Particle Description of Light, continued

- A photon is a particle of electromagnetic radiation having zero mass and carrying a quantum of energy.
- The energy of a particular photon depends on the frequency of the radiation.

 $E_{photon} = hv$

Chapter 4

Section 1 The Development of a New Atomic Model

Bohr Model of the Hydrogen Atom

- Niels Bohr proposed a hydrogen-atom model that linked the atom's electron to photon emission.
- According to the model, the electron can circle the nucleus only in allowed paths, or *orbits*.
- The energy of the electron is higher when the electron is in orbits that are successively farther from the nucleus.

Section 1 The Development of a New Atomic Model

The Hydrogen-Atom Line-Emission Spectrum

- The lowest energy state of an atom is its ground state.
- A state in which an atom has a higher potential energy than it has in its ground state is an excited state.

Chapter 4 Section 1 The Development of a New Atomic Model

Bohr Model of the Hydrogen Atom, continued

- When an electron falls to a lower energy level, a photon is emitted, and the process is called *emission.*
- Energy must be added to an atom in order to move an electron from a lower energy level to a higher energy level. This process is called *absorption*.

Chapter 4 Section 2 The Quantum Model of the Atom

Lesson Starter

- Write down your address using the format of street name, house/apartment number, and ZIP Code.
- These items describe the location of your residence.
- How many students have the same ZIP Code? How many live on the same street? How many have the same house number?

Chapter 4 Section 2 The Quantum Model of the Atom

Objectives, continued

- List the four quantum numbers and describe their significance.
- Relate the number of sublevels corresponding to each of an atom's main energy levels, the number of orbitals per sublevel, and the number of orbitals per main energy level.

Chapter 4 Section 2 The Quantum Model of the Atom

Lesson Starter, continued

- In the same way that no two houses have the same address, no two electrons in an atom have the same set of four quantum numbers.
- In this section, you will learn how to use the quantum-number code to describe the properties of electrons in atoms.

Chapter 4 the Atom

Section 2 The Quantum Model of the Atom

Electrons as Waves

- French scientist Louis de Broglie suggested that electrons be considered waves confined to the space around an atomic nucleus.
- It followed that the electron waves could exist only at specific frequencies.
- According to the relationship *E* = *h*v, these frequencies corresponded to specific energies—the quantized energies of Bohr's orbits.

Chapter 4 Section 2 The Quantum Model of the Atom

Objectives

- **Discuss** Louis de Broglie's role in the development of the quantum model of the atom.
- Compare and contrast the Bohr model and the quantum model of the atom.
- Explain how the Heisenberg uncertainty principle and the Schrödinger wave equation led to the idea of atomic orbitals.

Chapter 4 Section 2 The Quantum Model of the Atom

Electrons as Waves, continued

- Electrons, like light waves, can be bent, or diffracted.
- Diffraction refers to the bending of a wave as it passes by the edge of an object or through a small opening.
- Electron beams, like waves, can interfere with each other.
- · Interference occurs when waves overlap.

Chapter 4 Section 2 The Quantum Model of the Atom

The Heisenberg Uncertainty Principle

- German physicist Werner Heisenberg proposed that any attempt to locate a specific electron with a photon knocks the electron off its course.
- The Heisenberg uncertainty principle states that it is impossible to determine simultaneously both the position and velocity of an electron or any other particle.

Chapter 4 Section 2 The Quantum Model of the Atom

Atomic Orbitals and Quantum Numbers

- Quantum numbers specify the properties of atomic orbitals and the properties of electrons in orbitals.
- The **principal quantum number**, symbolized by *n*, indicates the main energy level occupied by the electron.
- The angular momentum quantum number, symbolized by *I*, indicates the shape of the orbital.

Section 2 The Quantum Model of Chapter 4 the Atom

The Schrödinger Wave Equation

- In 1926, Austrian physicist Erwin Schrödinger developed an equation that treated electrons in atoms as waves.
- Together with the Heisenberg uncertainty principle, the Schrödinger wave equation laid the foundation for modern quantum theory.
- Quantum theory describes mathematically the wave properties of electrons and other very small particles.

Chapter 4

Section 2 The Quantum Model of the Atom

Atomic Orbitals and Quantum Numbers, continued

- The magnetic quantum number, symbolized by m, indicates the orientation of an orbital around the nucleus.
- The **spin quantum number** has only two possible values—(+1/2, -1/2)—which indicate the two fundamental spin states of an electron in an orbital.

Chapter 4 Section 2 The Quantum Model of the Atom

The Schrödinger Wave Equation, continued

- Electrons do not travel around the nucleus in neat orbits, as Bohr had postulated.
- Instead, they exist in certain regions called orbitals.
- An orbital is a three-dimensional region around the nucleus that indicates the probable location of an electron.

Chapter 4 Section 3 Electron Configurations

Lesson Starter

- The electron configuration of carbon is 1s²2s²2p².
- An electron configuration describes the arrangement of electrons in an atom.
- The integers indicate the main energy level of each orbital occupied by electrons.
- The letters indicate the shape of the occupied orbitals.
- The superscripts identify the number of electrons in each sublevel.

Chapter 4 Section 3 Electron Configurations

Objectives

- List the total number of electrons needed to fully occupy each main energy level.
- State the Aufbau principle, the Pauli exclusion principle, and Hund's rule.
- Describe the electron configurations for the atoms of any element using *orbital notation, electronconfiguration notation,* and, when appropriate, *noblegas notation.*

Chapter 4 Section 3 Electron Configurations

Rules Governing Electron Configurations, continued

 According to Hund's rule, orbitals of equal energy are each occupied by one electron before any orbital is occupied by a second electron, and all electrons in singly occupied orbitals must have the same spin state.

Chapter 4 Section 3 Electron Configurations

Electron Configurations

- The arrangement of electrons in an atom is known as the atom's electron configuration.
- The lowest-energy arrangement of the electrons for each element is called the element's ground-state electron configuration.

Chapter 4 Section 3 Electron Configurations

Representing Electron Configurations

 \uparrow

Orbital Notation

- An unoccupied orbital is represented by a line, with the orbital's name written underneath the line.
- · An orbital containing one electron is represented as:

Chapter 4 Section 3 Electron Configurations

Rules Governing Electron Configurations

- According to the Aufbau principle, an electron occupies the lowest-energy orbital that can receive it.
- According to the Pauli exclusion principle, no two electrons in the same atom can have the same set of four quantum numbers.

Representing Electron Configurations, *continued*

Orbital Notation

- · An orbital containing two electrons is represented as:
- The lines are labeled with the principal quantum number and sublevel letter. For example, the orbital notation for helium is written as follows:

↑↓

Chapter 4 Section 3 Electron Configurations

Representing Electron Configurations, *continued*

Electron-Configuration Notation

- Electron-configuration notation eliminates the lines and arrows of orbital notation.
- Instead, the number of electrons in a sublevel is shown by adding a superscript to the sublevel designation.
- The helium configuration is represented by 1s².
- The superscript indicates that there are two electrons in helium's 1s orbital.

Chapter 4 Section 3 Electron Configurations

Elements of the Second Period, continued

- The *highest-occupied energy level* is the electroncontaining main energy level with the highest principal quantum number.
- Inner-shell electrons are electrons that are not in the highest-occupied energy level.

Chapter 4 Section 3 Electron Configurations

Representing Electron Configurations, *continued*

Sample Problem A

The electron configuration of boron is $1s^22s^22p^1$. How many electrons are present in an atom of boron? What is the atomic number for boron? Write the orbital notation for boron.

Chapter 4 Section 3 Electron Configurations

Elements of the Third Period

• After the outer octet is filled in neon, the next electron enters the *s* sublevel in the *n* = 3 main energy level.

Noble-Gas Notation

- The Group 18 elements (helium, neon, argon, krypton, xenon, and radon) are called the **noble** gases.
- A **noble-gas configuration** refers to an outer main energy level occupied, in most cases, by eight electrons.

Chapter 4 Section 3 Electron Configurations

Elements of the Second Period

- In the first-period elements, hydrogen and helium, electrons occupy the orbital of the first main energy level.
- According to the Aufbau principle, after the 1s orbital is filled, the next electron occupies the s sublevel in the second main energy level.

Chapter 4 Section 3 Electron Configurations

Elements of the Fourth Period

- The period begins by filling the 4s orbital, the empty orbital of lowest energy.
- With the 4s sublevel filled, the 4p and 3d sublevels are the next available vacant orbitals.
- The 3d sublevel is lower in energy than the 4p sublevel. Therefore, the five 3d orbitals are next to be filled.

Chapter 4 Section 3 Electron Configurations

Elements of the Fifth Period

- In the 18 elements of the fifth period, sublevels fill in a similar manner as in elements of the fourth period.
- Successive electrons are added first to the 5s orbital, then to the 4d orbitals, and finally to the 5p orbitals.

Chapter 4 Section 3 Electron Configurations

Sample Problem B

- a. Write both the complete electron-configuration notation and the noble-gas notation for iron, Fe.
- b. How many electron-containing orbitals are in an atom of iron? How many of these orbitals are completely filled? How many unpaired electrons are there in an atom of iron? In which sublevel are the unpaired electrons located?

Chapter 4 Section 3 Electron Configurations

Sample Problem C

- a. Write both the complete electron-configuration notation and the noble-gas notation for a rubidium atom.
- Identify the elements in the second, third, and fourth periods that have the same number of highest-energy-level electrons as rubidium.
