

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Block: \_\_\_\_\_

**Introduction to Logic**

What comes next?

- a)  $9^2 =$  \_\_\_\_\_,      b)  $12345 \cdot 9 =$  \_\_\_\_\_,      c) 2, 4, \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_  
 $99^2 =$  \_\_\_\_\_,       $12345 \cdot 18 =$  \_\_\_\_\_,  
 $999^2 =$  \_\_\_\_\_,       $12345 \cdot 27 =$  \_\_\_\_\_,  
 $9,999^2 =$  \_\_\_\_\_,      \_\_\_\_\_ = \_\_\_\_\_  
 $99,999^2 =$  \_\_\_\_\_,  
 \_\_\_\_\_ = \_\_\_\_\_

- How did you know what came next in the above examples?
- You used **inductive reasoning**; you looked for a pattern, and applied it as a rule.

Examples of **conjectures** using inductive reasoning:

- All ice I have ever observed is cold, therefore all ice is cold.
- The sun has risen every day of my life, therefore it will rise tomorrow.
- I have always gotten an A in math class, therefore I will get an A in this math class
- All members of a sample got well from a medication, therefore the entire population will get well from this medication.
- \_\_\_\_\_

What are some problems with inductive reasoning? \_\_\_\_\_

What is useful about inductive reasoning?

- Use inductive reasoning to **disprove** a conjecture by finding a **counterexample**

Example: **All odd numbers are prime.**

Prove this conjecture **false** by finding a **counterexample**, an odd number that is not prime.

- A counterexample to this conjecture is the number \_\_\_\_\_.
- An example of a conjecture that uses inductive reasoning that can be disproved by a counterexample is (give the counterexample, too): \_\_\_\_\_

Vocabulary Review Fill in the descriptions for each term...

<b>Notation/Term</b>	<b>Description</b>
conjecture	
inductive reasoning	
counterexample	

**Conditional Statements**

Conditional Statements (If-Then):

- Examples:
  - If the weather is nice, then I will wash the car.
  - If 2 divides evenly into x, then x is a positive number.
  - Your turn: \_\_\_\_\_
- Sometimes have to put into if-then form...
  - All birds have feathers  
\_\_\_\_\_
  - Two angles are supplementary if they are a linear pair.  
\_\_\_\_\_

*Forms of Conditional Statements*

Notation: Let  $p$  represent the hypothesis of a conditional, and  $q$  represent the conclusion

- **If  $p$  then  $q$**  also written as  $p \rightarrow q$ ; stated as “ **$p$  implies  $q$** ”
- Conditionals have **converse**, **inverse**, and **contrapositive** statements
- *Example 1:* All birds have feathers
- **Conditional:** If an animal is a bird, then it has feathers
- **Converse:**  $q \rightarrow p$ ; exchange hypothesis and conclusion  
\_\_\_\_\_
- **Inverse:**  $\sim(p \rightarrow q)$  or  $\sim p \rightarrow \sim q$ ; negate hypothesis and conclusion  
\_\_\_\_\_
- **Contrapositive:**  $\sim q \rightarrow \sim p$ ; converse of the inverse  
\_\_\_\_\_
- *Example 2:* Two angles are supplementary if they are a linear pair.
- **Conditional:** \_\_\_\_\_
- **Converse:** \_\_\_\_\_
- **Inverse** \_\_\_\_\_
- **Contrapositive** \_\_\_\_\_

Write the conditional if-then form, converse, inverse, and contrapositive forms of the following statements. Assuming the original statement is true; decide whether the other forms are true or false.

<p>1) All cats are mammals.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>	<p>2) Baseball players are athletes.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>	<p>3) All <math>180^\circ</math> <math>\angle</math>s are straight <math>\angle</math>s.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>
---	--	--

You Try...

<p>1) Guitar players are musicians.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>	<p>2) All Great Danes are large.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>	<p>3) A polygon is regular if it is equilateral.</p> <p>if-then:</p> <p>converse:</p> <p>inverse:</p> <p>contrapositive:</p>
---	--	--

- What can we inductively conclude about the converse and inverse of a statement?
- What can we inductively conclude about a conditional statement and its contrapositive?
- They are \_\_\_\_\_ statements (have the same truth value).

*Biconditional Statements*

- Statements where the **original** statement and **converse** are **BOTH true**
- Use the words “if and only if” (IFF)
- Notation:  $p \leftrightarrow q$
- Example: An animal meows IFF it is a cat. Other examples?
- Which of the previous examples are biconditional?

*Compound Logic Statements*

- **conjunction:** A compound logic statement formed using the word **and**
- **disjunction:** A compound logic statement formed using the word **or**
- Example:
  - $p$ : Joes eats fries                       $q$ : Maria drinks soda
  - $p \wedge q$ : Joe eats fries and Maria drinks soda
  - $p \vee q$ : Joe eats fries or Maria drinks soda
  - A conjunction is true IFF only both parts are true
  - A disjunction is false IFF only both parts are false
- You try: Write the statement in symbolic form, or translate the symbols to English...
 

a: We go to school on a holiday    b: Arbor Day is a holiday    c: We work on Arbor Day

  - 1) We work on Arbor Day or Arbor Day is a holiday. \_\_\_\_\_
  - 2) Arbor Day is a holiday and we do not work on Arbor Day. \_\_\_\_\_
  - 3) If we go to school on a holiday and Arbor Day is a holiday then we work on Arbor Day  
\_\_\_\_\_
  - 4)  $a \wedge c$  \_\_\_\_\_
  - 5)  $b \vee c \wedge \sim a$  \_\_\_\_\_
  - 6)  $(\sim a \wedge b) \rightarrow c$  \_\_\_\_\_

*Vocabulary Review*

<i>Term</i>	<i>Description</i>	<i>Notation</i>
conditional statement	A logical statement that has a hypothesis and conclusion; can be put in the form "if-then."	$p \rightarrow q$
hypothesis	The "if" part of a conditional statement.	$p$
conclusion	The "then" part of a conditional statement.	$q$
negation	The opposite of the original statement or clause.	$\sim p$
converse	The statement formed if the hypothesis and conclusion are switched.	$q \rightarrow p$
inverse	The statement formed by negating both the hypotheses and conclusion.	$\sim p \rightarrow \sim q$
contrapositive	The statement formed by writing the converse of the inverse.	$\sim q \rightarrow \sim p$
biconditional statement	A statement whose converse is equivalent to the original form of the statement; contains "if and only if" (IFF).	$p \leftrightarrow q$
equivalent statements	Statements that have the same truth value (true or false).	N/A
conjunction	Compound logic statement using <i>and</i> .	$p \wedge q$
disjunction	Compound logic statement using <i>or</i> .	$p \vee q$
