Periodic Table of Elements

## Naming and Formula Review

You can print a copy of this note sheet.

## Elements

Most elements are monatomic (just write the symbol), some are diatomic and a few are polyatomic. The diatomic elements are hydrogen $\left(\mathrm{H}_{2}\right)$, nitrogen $\left(\mathrm{N}_{2}\right)$, oxygen $\left(\mathrm{O}_{2}\right)$, fluorine ( ), chlorine ( ), bromine ( ), and iodine ( ). The polyatomic elements are sulphur $\left(\mathrm{S}_{8}\right)$ and phosphorous $\left(\mathrm{P}_{4}\right)$.

## Complex or Polyatomic Ions

Most complex ions contain oxygen combined with another element.

$$
\text { Nitrate } \mathrm{NO}_{3}^{-} \quad \text { Sulphate } \mathrm{SO}_{4}^{2-} \quad \text { Phosphate } \mathrm{PO}_{4}{ }^{3-}
$$

The most common forms have the ending "ate" and a selection of these ions are found on page three of the data booklet. However this is not a complete list, but other ions can be generated by following family trends. A representative from each family is provided on the chart.

## Halogen "ates"

Chlorate $\mathrm{ClO}_{3}$
bromate $\quad \mathrm{BrO}_{3}{ }^{-}$iodate is $\qquad$ and fluorate is $\qquad$ .

## Column 16 "ates"

Sulphate $\quad \mathrm{SO}_{4}{ }^{2-} \quad$ What is selenate? $\qquad$

## Column 14 "ates"

Carbonate $\mathrm{CO}_{3}{ }^{2-} \quad$ What is silicate?
When the ending is changed to "ite" this tells us that the formula has one less oxygen than the "ate" form, but the charge remains the same.
$\begin{array}{llll}\text { Nitrate } & \mathrm{NO}_{3}{ }^{-} \quad \text { nitrite } & \mathrm{NO}_{2}{ }^{-}\end{array}$
Chlorate $\quad \mathrm{ClO}_{3}{ }^{-} \quad$ What is chlorite? $\qquad$
What is bromite? $\qquad$ iodite? $\qquad$
Phosphate $\quad \mathrm{PO}_{4}{ }^{3-} \quad$ What is phosphite? $\qquad$
When the prefix "per" is combined with the ending "ate" this tells us that the formula has one more oxygen than the "ate" form, but the charge remains the same.

What is perchlorate? $\qquad$ perbromate? $\qquad$ periodate? $\qquad$
What is peroxide? $\qquad$ perphosphate? $\qquad$ persulphate? $\qquad$
When the prefix "hypo" is combined with the ending "ite" this tells us that the formula has two less oxygen than the "ate" form (or one less than the "ite" form), but the charge remains the same.

What is hypochlorite? $\qquad$ hypobromite? $\qquad$ hypoiodite? $\qquad$
What is hypophosphite? $\qquad$ hyposulphite? $\qquad$ hypocarbonite? $\qquad$

## Acids

Acids are recognized by the presence of an " H " in the front of the formula. Acids are covalently bonded molecules, but they are named ionically. This is because acids react with water to produce ions. This is similar to salts (ionic compounds) which are pulled apart by water to produce ions.

$$
\begin{aligned}
& \mathrm{HCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{Cl}^{-} \\
& \mathrm{NaCl} \rightarrow \mathrm{Na}^{+}+\mathrm{Cl}^{-}
\end{aligned}
$$

Write the formula for the following acids:
Hydrogen sulphate $\qquad$
Hydrogen perbromate $\qquad$
Hydrogen phosphite $\qquad$
Hydrogen hypoiodite $\qquad$
Name the following acids. We use the ionic rules for naming.
$\mathrm{HClO}_{3}$ $\qquad$
$\mathrm{H}_{2} \mathrm{~S}$ $\qquad$
Unfortunately the common names for acids are still used. These names need to be translated into their IUPAC form in order to write the correct formula. The translations are as follows:

Common Name
Hydro $\qquad$ ic acid
$\qquad$ ic acid ous acid
$\qquad$
" is the root name for the element. The following are examples chlor, brom, iod, sulphur, phosphor, nitr, carbon, cyan....

Write the IUPAC name and the formula for each of the following acids.

| Common Name | IUPAC Name | Formula |
| :--- | :--- | :--- |
| Sulphurous acid |  |  |
| Phosphoric acid |  |  |
| Hydroiodic acid |  |  |
| Perbromic acid |  |  |
| Hypochlorous acid |  |  |
| Nitrous acid |  |  |
| Fluoric acid |  |  |

Practice these rules!

## Naming and Formula Practice

Name: $\qquad$
**Use the periodic table of elements for transition metal charges that are not on page 3 of the data booklet.

1. Practice for "ates". Ate is the suffix used for the most common polyatomic ion.

Write the correct name:
a. $\mathrm{Ca}\left(\mathrm{ClO}_{3}\right)_{2}$
b. $\mathrm{NaBrO}_{3}$
c. $\mathrm{Zn}\left(\mathrm{IO}_{3}\right)_{2}$
d. $\mathrm{Fe}\left(\mathrm{NO}_{3}\right)_{3}$
e. $\mathrm{H}_{3} \mathrm{PO}_{4}$
f. $\mathrm{NiSO}_{4}$
g. $\mathrm{CdSeO}_{4}$
h. $\mathrm{Na}_{2} \mathrm{CO}_{3}$
i. $\mathrm{Cs}_{2} \mathrm{SiO}_{3}$

Write the correct formula:
a. Palladium (II) iodate
f. Nickel (III) chlorate
b. Barium carbonate
g. Radium phosphate
c. Hydrogen silicate
h. Lithium selenate
d. Gold (III) sulphate
i. Lead (II) nitrate
e. Potassium bromate
2. Practice for "ites". What does "ite" tell you about the charge and number of oxygen?

Write the correct name:
a. $\mathrm{NaClO}_{2}$
b. $\mathrm{Al}_{2}\left(\mathrm{SO}_{3}\right)_{3}$
c. $\mathrm{H}_{2} \mathrm{CO}_{2}$
d. $\mathrm{Cu}_{3} \mathrm{PO}_{3}$
e. $\mathrm{Cd}\left(\mathrm{NO}_{2}\right)_{2}$
f. $\mathrm{Hg}_{2}\left(\mathrm{IO}_{2}\right)_{2}$
g. $\mathrm{Sr}\left(\mathrm{BrO}_{2}\right)_{2}$

Write the correct formula:
a. Platinum (IV) iodite
e. Lead (II) nitrite
b. Magnesium chlorite
f. Mercury (II) bromite
c. Nickel (III) sulphite
g. Cesium carbonite
d. Potassium phosphite
3. Practice for "per...ates". What does "per" tell you about the charge and number of oxygen?

Write the correct name:
a. $\mathrm{Au}\left(\mathrm{BrO}_{4}\right)_{3}$
b. $\mathrm{Sr}\left(\mathrm{ClO}_{4}\right)_{2}$
c. $\mathrm{Na}_{2} \mathrm{O}_{2}$
d. $\mathrm{H}_{2} \mathrm{SO}_{5}$
e. $\mathrm{Fe}\left(\mathrm{IO}_{4}\right)_{2}$
f. $\mathrm{H}_{2} \mathrm{O}_{2}$

Write the correct formula:
a. Mercury (II) perchlorate
d. Zirconium periodate
b. Tungensten (V) perbromate
e. Nickel (III) perfluorate
c. Potassium peroxide
4. Practice for "hypo...ites". What does "hypo" tell you about the charge and number of oxygen?

Write the correct name:
a. CsBrO
b. HCIO
c. NaIO
d. $\mathrm{Sc}(\mathrm{NO})_{3}$
e. $\mathrm{Mn}\left(\mathrm{SO}_{2}\right)_{2}$

Write the correct formula:
a. Calcium hypoiodite
d. Titanium (III) hypobromite
b. Palladium (IV) hypochlorite
e. Francium hyposulphite
c. Cobalt (III) hyponitrite
5. Practice for elements. What are the seven diatomic elements? What are the two polyatomic elements?

Write the correct name:
a. Al
b. $\mathrm{S}_{8}$
c. $\mathrm{N}_{2}$
d. $\mathrm{I}_{2}$
e. Au

Write the correct formula
a. Silver
d. Phosphorous
b. Oxygen
e. Tin
c. Chlorine
6. Practice for the acids. You must be able to write formulas from common names. This means you must memorize the translation to the IUPAC name.
Common Name

IUPAC translation

Hydro $\qquad$ ic acid becomes
$\qquad$ ic acid becomes

Per $\qquad$ ic acid becomes
$\qquad$ ous acid beomes
Hypo $\qquad$ ous acid becomes

Write the IUPAC and common name:
a. $\mathrm{HBrO}_{2}$
b. HBr
c. $\mathrm{HClO}_{4}$
d. $\mathrm{H}_{2} \mathrm{SO}_{4}$
e. $\mathrm{H}_{3} \mathrm{PO}_{4}$
f. $\mathrm{H}_{3} \mathrm{PO}_{3}$
g. $\mathrm{HBrO}_{3}$
h. HIO
i. $\mathrm{HClO}_{2}$
j. $\mathrm{HNO}_{3}$
k. $\mathrm{HNO}_{2}$

Write the formula:
a. Iodous acid
f. Nitrous acid
b. Hydrosulphuric acid
g. Hydrofluoric acid
c. Perbromic acid
d. Hypophosphorous acid
e. Sulphurous acid
