PSI Short Form Profile

Score Summary

Scale	Raw Score	Percentile	Raw Score Norms	
			Mean	SD
Defensive Responding	17	85	13.9	5.2
Total Stress	88	85	71.0	15.4
Parental Distress (PD)	28	65	26.4	7.2
Parent-Child Dysfunctional Interaction (P-CDI)	31	95	18.7	4.8
Difficult Child (DC)	29	70	26.0	6.7

16 - 80 Percentile: Normal Range
81 - 84 Percentile: Borderline
85 - 99+ Percentile: Clinically Significant

NOTE: Defensive Responding is clinically significant when the score is 10 or less.

Interpretation of Protocol

Defensive Responding

This appears to be a valid protocol.

Total Score

This parent is experiencing more stress than the average parent, but falls in the borderline clinical range with regard to the need for follow-up and referral. The possible need for services should be discussed with the parent, along with the apparent primary sources of stress.

Parental Distress

This parent appears to be experiencing a normal degree of parenting distress as a function of his personal characteristics. The parent's personal adjustment to parenting does not appear to be a source of stress.

Parent-Child Dysfunctional Interaction

This parent is highly distressed by the quality of his parent-child interaction. This child does not meet his expectations. The parent likely feels alienated from his child and may feel to some degree rejected or abused by his child's behavior. The potential for dysfunctional parenting behavior is high, and immediate follow-up services are recommended. This parent should be provided support to help ensure follow-through with regard to follow-up services.

Difficult Child

This parent's perception of his child's behavioral characteristics suggests that his child's functioning falls for the most part within normal limits. Deviations from normal functioning are not perceived as excessively disruptive or destructive to the parent-child relationship.
