

**830 9.4 GEOMETRY'S MOST ELEGANT THEOREM
STUDENT GUIDED NOTES**

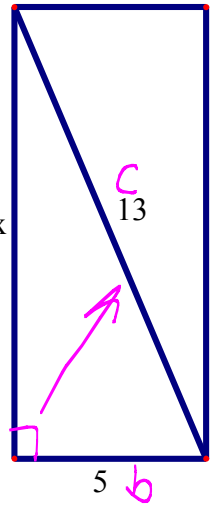

<p>Theorem 69</p>	<p>The <u>square</u> of the measure of the <u>hypotenuse</u> of a <u>right triangle</u> is equal to the <u>sum</u> of the squares of the measures of the <u>legs</u>.</p>	<p align="center">Pythagorean Thm.</p>  <p align="center">$a^2 + b^2 = c^2$</p>
<p>Theorem 70</p>	<p>If the square of the measures of <u>one</u> side of a triangle equals the sum of the <u>squares</u> of the measures of the other sides, then the angle <u>opposite</u> the longest side is a right angle.</p> <p align="center"><i>* hypotenuse is always longest</i></p>	<p>If $a^2 + b^2 = c^2$, then this is a right triangle with <u>$\neq C$</u> as the right angle.</p>
		<p>$a^2 + b^2 > c^2$ $\angle C$ Acute</p> <p><u>$a^2 + b^2 = c^2$</u> $\angle C$ Right</p> <p>$a^2 + b^2 < c^2$ $\angle C$ Obtuse</p>

1. Solve for x .

$x^2 = 8^2 + 6^2$
 $x^2 = 64 + 36$
 $\sqrt{x^2} = \sqrt{100}$
 $x = \pm 10$ (reject -10)
 $x = 10$

2. Find the perimeter of the rectangle shown.

$x^2 + 5^2 = 13^2$
 $x^2 + 25 = 169$
 $\sqrt{x^2} = \sqrt{144}$
 $x = \pm 12$ (reject -12)
 $x = 12$

$12 + 12 + 5 + 5 = 34$

3. Find the perimeter of a rhombus with diagonals of 6 and 10.

$$x^2 = 3^2 + 5^2$$

$$x^2 = 9 + 25$$

$$\sqrt{x^2} = \sqrt{34}$$

$$x = \sqrt{34}$$

$$P = 4\sqrt{34}$$

4. Nadia skipped 3m north, 2m east, 4m north, 13m east, and 1m north. How far is Nadia from where she started?

$$x^2 = 15^2 + 8^2$$

$$x^2 = 225 + 64$$

$$x^2 = 289$$

5. Find the altitude of an isosceles trapezoid whose sides have lengths of 10, 30, 10, and 20.

$$10^2 = 5^2 + x^2$$

$$100 = 25 + x^2$$

$$\sqrt{75} = \sqrt{x^2}$$

$$\pm 5\sqrt{3} = x$$

$$5\sqrt{3} = x$$

6. Classify the triangle shown.

$$a^2 + b^2 < c^2$$

$$7^2 + 5^2 < 8^2$$

$$49 + 25 < 64$$

$$74 < 64$$

acute
scalene

7. PQRS is a kite.

$$\overline{SP} \perp \overline{PQ}$$

$$\overline{PS} \cong \overline{SR}$$

$$PR = 12, SQ = 13$$

Find ST, SP, PQ, perimeter.
