## **CORNELL NOTES**

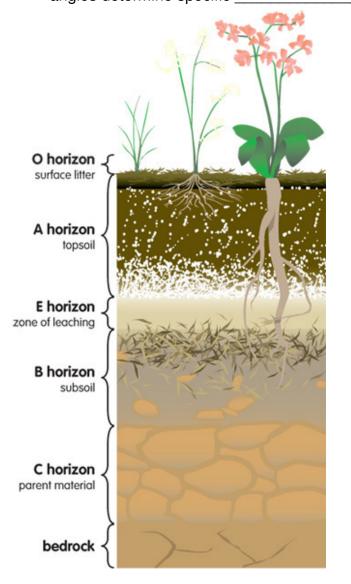

Directions: You must create a minimum of **5 questions** in this column **per page** (average). Use these to study your notes and prepare for tests and quizzes. Notes will be turned in to your teacher at the end of the Unit for scoring.

## UNIT 4: Earth Science Chapter 21: Earth's Changing Surface (pages 644-683)

I. Weathering	and Soil
A breakc	process of physical or chemical lown of a material at or near Earth's surface.
	1. Involves the interaction of <b>air</b> , <b>water</b> , and <b>rock</b> over
	2. Everyday weathering- is going on all around you everyday
В. <b>Ме</b> с	chanical Weathering- "turning big pieces into little pieces"
	1. Prying rock apart
	a can enter fractures in rock. When freezes and expands will crack apart
	b. <b>Growing roots</b> example of biological force
	c. <b>Rocks</b> can act as <b>agents</b> . Falling rocks can hit and split other rocks
	Smaller rocks have greater surface area to volume which increases likelihood that material will be attacked by agents
C. Che	emical Weathering
	Forms new compounds and release elements into the
	a. Elements released enrich soil and nourish
	b. Without weathering of rocks there would be no
	2. Matter on the Move- Cycles of chemical weathering affect all environments from to
	3. Rock Rust is a common weathering process
	a. Iron combines with oxygen to form iron oxide

b. Other minerals also for a contract oxidizes	orm oxide minerals (i.e. s to greenish-colored patina		
4. Feldspar Weathering- impo	ortant process for		
5. <b>Differential Weathering</b> - different rock formations ten to weather at different			
D. <b>Soil</b> - <u>mixture</u> of weathered rock, organic matter, water, and air that is capable of <b>supporting plant</b>			
1. <b>Soil</b> laye	ers with unique texture and		
a. <b>Soil</b> given area	_ shows specific layers for		

b. Composition of parent **bedrock**, **climate**, kind of **organisms** on surface, **shape of land**, **slope** angles determine specific \_\_\_\_\_\_.

2. <b>Soil</b>	l <b>Types</b> - many differ	ent types
	a many types of soil	used as basis to characterize
	b. Separated by corproperties	mposition and
	c. <b>Precipitation</b> and that fo	d <b>temperature</b> range affect rms
	dsupply of <b>organic n</b>	important for providing natter
	e. In arctic and des vegetation, there is	erts where there is <u>no</u>
3. Pare	ent material-	
	a. Some parent bedrock	form in <b>same place</b> as
		s from <b>transported materials</b> s ( and <b>glaciers</b> )
II. Shaping the Land	Iscape	
A. Erosion, T	ransport, ad Deposit	ion
1. Mou	untains and other lan	dforms subject to <b>continuous</b>
	a	a factor
	b. Action of	_,, or
2 proces	remo ss of weathering	val of surface material through
3 materi <b>glacie</b>	al from one place to	nsport- movement of eroded another by water, wind, and/or
4 load of	- Wi f eroded material	nen transporting agent drops it
B. Running W	Vater €	
	inage basins- all the	e land that gathers

	a. Like branching tree (include)
	b. Drainage basins in area for major rivers
	annel Development- a path for water created by
	a. Rivers can createshaped valleys
	b. <b>Steep canyons</b> can form when downcutting is
3. <b>Str</b> sedim	eam accumulations or bars of ent in stream channels
	a. Sediment is dropped when running water
	b. Usually forms on <b>inside bend</b> of rivers where speeds are
	odplains- sediment left after floodwaters subside the valley
	a. Floodplain part of river, but only submerged during
	b. Can rejuvenate quality
C. Glaciers	
1. For	med when winter snowfall exceeds summer melt
	a. Must take place <b>year after year</b> for hundreds to thousands of
	b. Compaction within thick mass of snow createsice
	c. Begins to <b>spread out</b> under its own
	d. Become effective agents of
	e. As ice moves, act like <b>giant</b> scraping, gouging, and plucking soil and surface rocks

## 2. Erosional features a. Valley and continental glaciers leave behind deep grooves or striations b. Glaciers convert -shaped valleys into -shaped valleys c. **Cutting force** is dependent on d. Bowl shaped depression (cirque) is formed where first accumulates 3. Glacier deposits a. When glaciers , they dump material they were carrying b. Material called \_\_\_\_\_- composed of random sediments ranging in size from tiny clay particles to house-sized boulders c. \_\_\_\_\_- large ridges of till that accumulates at edge of glacier 1). **End moraine** forms at of glacier 2). Lateral moraine- forms at \_\_\_\_\_ of alacier 3). **moraines**- formed when glaciers join together 4). **Ground moraine**- forms melting continental ice sheets d. Deposits of outwash material are layered and sorted by \_\_\_\_\_ by action of water e. Deposits in flat areas often become fertile

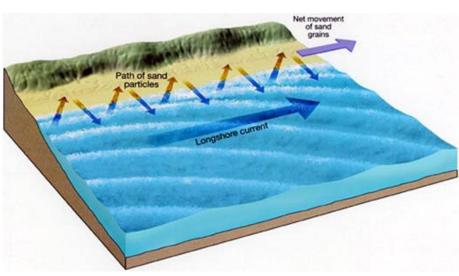

1. Wind ability to pick up and carry large

a. Can act like \_\_\_\_\_-blaster

D. Wind

particles

	b. Can	and <b>smooth</b> la	andforms
2. Erd	osion by wind		
	a particles by wi	the removal o	f small
	b texture caused	<b> pavement</b> - rocky, by deflation	rough
3. <b>Wi</b> decre	-	diment dropped as	
		sizes of landforms depend velocity is and supply	
	b particles	form as wind moves	sand-sized
E. Wave Act	tion		
	treme water	operate where <b>la</b>	nd meets
2. Cu	rrents from wav	e action	
	a	churn up beach sedim	ent
	b. <b>Sediment</b> o	arried back toward	
	c. Then moved transporting	toward shore at angle- ediment (	current)
		Net movement	

	a. Action of <b>waves</b> with sediment works like and causes <b>abrasion</b>
	b. Results in pebbles and cobbles on beach
4. De <sub>l</sub>	position by wave action
	a. Sediments can be deposited as offshore sand ridges or
	b bar- sandbar that seals off a bay
	c sand bars that project into water from land and curve back toward land in a hook shape
	d islands- sand deposits formed offshore
F. Mass Was	sting
1. Wh	en erosion occurs as a result of
	a. Occurs where <b>slopes are overly steep</b> or lacking
	b. Usually <u>begins</u> when support at <b>base</b> of slope is
2. Ero	sion by mass wasting
	a. Dependent upon type of <b>event</b> and type of involved
	b. <b>Landslides</b> or <b>rockslides</b> can produce distinct on slopes
	c. <b>Mudflows</b> occur after heavy or snowmelt
3. De <sub>l</sub>	position by mass wasting
	a. Materials in disorganized masses
	b. Material replaces <b>undermined</b> material at

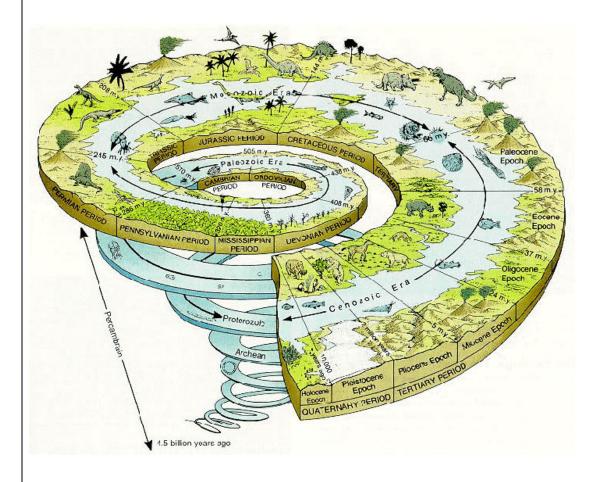

3. Erosion from wave action

	c. Slope becomes <b>stabilized</b> when material builds up and <b>mass wasting</b>
III Groundwater	
A. The Wate	er Cycle
1. <b>O</b> c	eans contain% of Earth's water
	a. <b>2.8%</b> is (3/4's tied up in <b>glacial ice</b> )
	b. Less than% of Earth's water available
2. Wa	ater cycle
	a. The cycling of freshwater
	b. Enters cycle through of seawater
	c. Lesser amount enters through(from plant leaves as water vapor)
	d. <u>provides</u> <b>energy</b> for evaporation and transpiration
	e. Water vapor forms <b>clouds</b> which provide
	f. Most precipitation goes back to
	g. Water falling on land can <b>evaporate</b> , <b>runoff</b> as stream flow, or <b>infiltrate Earth</b>
	H process by which water enter Earth to become <b>groundwater</b> below surface
B. Groundwa	ater
1. Wa	ater stored underground
	a. Moves through spaces of sediment and rock
	b <b>zone</b> - region near surface where water infiltrates freely
	czone- area below where water completely fills pore space

	zones		
2. Gro	2. Groundwater storage		
	a. Absorption of water depends on material, saturation level, and		
	b A rock unit that can transmit water through its pore space		
	1). <b>Sandstone</b> and <b>limestone</b> make aquifers		
	2). Shale or clay or or		
3. Por	osity and Permeability		
	a. Combined volume of pore spaces defines materials		
	b measure of how well a fluid can pass through a material		
C. Water Res	sources		
1. Obt	aining groundwater		
	a where water table intersects the ground surface		
	a where water table intersects the ground surface  b holes dug or drilled into Earth to reach water table		
	b holes dug or drilled into Earth to		
2. Wa	b holes dug or drilled into Earth to reach water table  c. Natural of groundwater has both		
2. Wa	b holes dug or drilled into Earth to reach water table  c. Natural of groundwater has both horizontal and vertical components		
2. Wa	b holes dug or drilled into Earth to reach water table  c. Natural of groundwater has both horizontal and vertical components  ter under pressure  a wells- wells drilled into aquifers that are under natural pressure to force		
	b holes dug or drilled into Earth to reach water table  c. Natural of groundwater has both horizontal and vertical components  ter under pressure  a wells- wells drilled into aquifers that are under natural pressure to force water up into well		

d. Water \_\_\_\_\_- boundary separating two

	b. Particles can	larger contaminants
	c. Some can arsenic)	groundwater (i.e.
IV. Geologic Tim	е	
A. Time		
1. /	Absolute and Relative Da	ting
	a <b>da</b> <u>precise</u> numerical age event	ating- process of assigning a e to an organism, object, or
	b objects or events in the	dating- process of placing neir proper sequence of time
	<b>Uniformitarianism</b> - state erates they	
		eologic events take place events took place in the past
	b. "The	is the key to the"
B. Princip	les of Relative Dating	
	Principle of superposition  disturbed sequence of roce	<b>on</b> - the <u>oldest rocks</u> in an ck layers will be at the
2. <b>Original Horizontality</b> - sedimentary layers start off		
	a. If layers <u>not horizor</u>	ntal they have been
	b. Must have been m	oved by some
		Any <b>rock formation</b> or <b>fault</b> is rock or feature that it cuts
		nt in the real record
dui	ring which <b>erosion</b> occurr	ent in the rock record red or <b>deposition</b> was absent
C. Fossils		
	remains he geologic rock record	or traces of organisms found

2 disti	- The process of matching nctive rock units from different regions		
	a. Used by <b>paleontologists</b> in correlating fossil-bearing rock units on a scale		
	b fossils- organisms what were widespread geographically, but lived in narrow, well-defined period of time		
3. <b>Geologic Time Scale</b> - boundaries of time that existence of certain life forms and catastrophic geologic events			
D. Absolute	Dating		
1. Us	se the <b>radioactive atoms</b> in minerals like a to measure passing of time		
2. <b>R</b> a	adioactive decay- some types of atoms are and decay to produce new isotopes		
	alf-life- the time it takes for 1/2 of a radioactive ple to		

	ı <b>rbon-14</b> useful in datir <b>nisms</b>	ng	
	her isotopes used to da ered minerals in		
	1). Use isotopes with lives	very	half-
	2). <u>Do not</u> use <b>sedim metamorphic</b> rock b or other composition	ecause action o	f
E. <b>Geologic Maps</b> formations	- show horizontal distri	bution of various	s rock
1. <u>forces</u> due t <b>downward</b>	<b>and</b> o plate tectonics cause	- <u>compressior</u> layer to <b>fold</b> ar	<u>ıal</u> ıd <b>dip</b>
2compression	folding and wrinkli n	ng of crust caus	ed by
3. <b>Plunging</b> folds	Folds-	_ forces produce	tilted

4. Useful Isotopes
