## **B.** Electron Configurations

Use the diagonal rule to write the electron configurations for the following elements.

| 1. lithium  |  |
|-------------|--|
| 2. nitrogen |  |
| 3. zinc     |  |
| 4. bromine  |  |
| 5. barium   |  |

## C. Electron Dot Diagram

## **EXAMPLE: Electron Dot Diagram**

Write the electron dot diagram for nitrogen. Solving process:

Use the orbital filling diagrams of Section 8:11 in the textbook to help you write the electron dot diagrams for the following elements.

1. oxygen

3. potassium

4. scandium

2. argon

CHAPTER 8 REVIEW MASTER

Date .

| 1.      | What is the maximum number of electrons that can be in the                                                                                                                                                                                  |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | a. second energy level?                                                                                                                                                                                                                     |
|         | b. third energy level?                                                                                                                                                                                                                      |
|         | c. fourth energy level?                                                                                                                                                                                                                     |
| 2.      | Which quantum number signifies the size of the electron cloud?                                                                                                                                                                              |
|         | The sublevel or shape of the electron cloud is designated by which quantum number?                                                                                                                                                          |
| 4.      | The orbital describes the direction in space of the electron cloud.<br>Which quantum number is used to represent the orbital?                                                                                                               |
| 5.      | The <i>s</i> quantum number is used to describe the clockwise and coun-<br>terclockwise rotation of the electrons in an orbital. What two numer-<br>ical values can <i>s</i> have?                                                          |
| 6.      | When $n$ has the numerical value 4, what values can $\ell$ have?                                                                                                                                                                            |
| 7.      | When $\ell = 3$ , what values can <i>m</i> have?                                                                                                                                                                                            |
| 8.      | How many orbitals are contained in the $p$ sublevel?                                                                                                                                                                                        |
| 9.      | How many orbitals are contained in the $d$ sublevel?                                                                                                                                                                                        |
| 10.     | How many electrons can be in one orbital?                                                                                                                                                                                                   |
| 11.     | What is the maximum number of electrons that can be in the $p$ sublevel?                                                                                                                                                                    |
| 12.     | What is the maximum number of electrons that can be in the $f$ sub-<br>level?                                                                                                                                                               |
| 13.     | What is the maximum number of electrons that can be in a $d$ sublevel?                                                                                                                                                                      |
| 14.     | What names are used for the three <i>p</i> orbitals?                                                                                                                                                                                        |
| 15.     | What is the name of the scientist who stated that no two electrons<br>in the same atom can have the same set of four quantum numbers?                                                                                                       |
| 16.     | What is the name of the scientist who pointed out that it is impos-<br>sible to know both the exact position and the exact momentum of an<br>electron at the same time?                                                                     |
| 17. 17. | What is the name of the scientist who treated the electron mathe-<br>matically as a wave?                                                                                                                                                   |
| 18.     | Mechanics is a word used to describe a system of mathematical<br>equations. Which system of mathematical equations is used to de-<br>scribe the behavior of extremely small particles traveling at veloci-<br>ties near the speed of light? |
