MONTANA STATE HAZARD MITIGATION PLAN 2013 UPDATE RISK ASSESSMENT TEMPLATE

The State of Montana Hazard Mitigation Plan and Statewide Hazard Assessment profiles a number of hazards that can impact the lives and property of Montana's residents. As a supplement to the 2013 Update of this Plan, a Template Risk Assessment Methodology using Geographic Information System (GIS) technology has been developed to calculate loss estimates. The purpose of this Risk Assessment Template is to provide local jurisdictions a standard methodology to build upon and improve data presented in their local plans. The objective is to allow local jurisdictions to produce standardized risk assessments and "apple to apple" comparison of hazard risks across the state. The Risk Assessment Template is presented in three parts. Start with Part 1 and progress through the methodology.

The Risk Assessment Template is designed to address hazards quantitatively. Some hazards can only be addressed qualitatively due to a lack of data (communicable disease, drought, severe winter weather, terrorism). Methodology for qualitative analysis is not described in this document. Hazards profiled in the 2013 State Plan which are addressed in this document are listed below with the source of data used to develop the hazard layer. Hazard layers are available from the Montana Natural Resource Information System (NRIS) in Helena.

- DAM FAILURE A digital dam inundation hazard layer was developed by digitizing worst case inundation maps of high hazard dams, available in their Emergency Action Plans.
- EARTHQUAKE A digital earthquake hazard layer was developed using the U.S. Geological Survey (USGS) Peak Ground Acceleration Maps depicting a 2 percent probability of exceedance in a 50 years period.
- FLOODING A digital flood hazard layer was developed using Digital Flood Insurance Rate Maps (DFIRMS) and a flood model completed by the Federal Emergency Management Agency (FEMA) using their HAZUS-MH software.
- HAZARDOUS MATERIAL INCIDENTS A digital hazardous material incident hazard layer was developed by buffering by 0.25 mile the highways, railroads, and toxic release inventory (TRI) facility listings from the U.S. Environmental Protection Agency (EPA).
- LANDSLIDE A digital landslide hazard layer was developed using a USGS map of landslide susceptibility which included evaluating geologic formations as being of high, medium, or low susceptibility to landsliding. Susceptibility to landsliding was defined as the probable degree of response of the areal rocks and soils to natural or artificial cutting or loading of slopes or to anomalously high precipitation. Only the high and medium susceptibility formations were used in the PDM hazard layer.
- SEVERE SUMMER WEATHER A digital severe summer weather hazard layer was developed by plotting tornados, hail events over 0.75 inch, and thunderstorm wind events over 58 mph for the period 1995 to 2012 available from the National Climatic Data Center.
- WILDFIRE AND RANGELAND FIRE A digital map of wildland-urban interface areas compiled by the Montana Department of Natural Resources and Conservation (DNRC) from Community Wildfire Protection Plans (CWPPs) prepared by Montana counties was used to depict the wildfire hazard area.

PART 1 - ANNUALIZED PROPERTY LOSS CALCULATIONS

A1. HAZARD DATA – PROPERTY DAMAGE

SHELDUS (Spatial Hazard Events and Losses Database for the United States), data which can be found at: <u>http://webra.cas.sc.edu/hvri/products/sheldus.aspx</u>, provides data for the risk assessment for several hazards: severe winter weather, severe summer weather, and flooding. Go to "Data Downloads" and search by "Hazard Type, Location and Date" to download the data necessary for the risk assessment, as follows:

- Flooding hazard, search for: Flooding
- Severe Summer Weather hazard, search for: Hail, Severe Storm/Thunderstorm, Lightning, Tornado, Wind (between May and October)
- Severe Winter Weather hazard, search for: Avalanche, Winter Weather, and Wind events (between November and April)

Other sources of damage data include the following:

- Hazardous Material Incident hazard: Hazard frequency and damage data is available for Montana incidents (by county) from the U.S. Department of Transportation, Office of Hazardous Material Safety incident reports database at: https://hazmatonline.phmsa.dot.gov/IncidentReportsSearch/search.aspx
- Wildfire: Annualized loss for wildfire is computed using hazard frequency and suppression cost. Data is available by county from the Montana Department of Natural Resources-Fire in Missoula.

There may not be frequency or damage data for some hazards (i.e. dam failure, earthquake, landslide). In this case, annualized loss cannot be computed. However, number and value of building stock can be determined – go to Part 2 of the Risk Assessment Template for these hazards.

B1. FREQUENCY

For each hazard calculate the hazard frequency. This value is needed to determine annualized property loss. Frequency is:

Number of Incidents / Period of Record

Determine your period of record. Count the number of incidents in each data set and divide by the period of record to establish the hazard frequency.

• Example: 80 incidents / 50 year record = 1.6 frequency

C1. MAGNITUDE

For each hazard where damage data exists, calculate the magnitude. Magnitude is:

 (Property Damage / Number of Incidents) / Total \$ of Building Stock = Magnitude expressed as a percentage. In SHELDUS property damage adjusted to current dollars can be downloaded. Total \$ of building stock is from the Montana Department of Revenue's Cadastral Mapping Program [http://svc.mt.gov/msl/mtcadastral/].

Example: (\$1,026,785 property damage / 80 incidents) / \$41,155,665,000 building stock 12,834.8 / 41,155,665,000 = 0.0000003118 Magnitude = 0.0000318%

D1. ANNUALIZED PROPERTY LOSS – BUILDING STOCK

For hazards like flooding, wildfire, hazardous material incidents, etc. that occur in specific areas within the jurisdiction, go to **Part 2**. For hazards that are considered uniform across the jurisdiction (i.e. there is no regional variation; severe winter weather, severe summer weather) follow the methodology presented below to determine annualized property loss.

- Total Building Stock x Frequency x Magnitude
- Example: \$1,155,665,000 x 0.55 x 0.00224% (aka 0.0000224) = \$14,279

The total building stock data is available from the Montana Department of Revenue's Cadastral Mapping Program for residential and "other" properties which would include commercial, agricultural, and industrial. The following equation is used to determine how many buildings would be affected by the hazard event:

- Total Number of Buildings x Frequency x Magnitude
- Example: 5,332 x 0.55 x 0.00224% (aka 0.0000224) = 0.07 buildings

E1. ANNUALIZED PROPERTY LOSS – CRITICAL FACILITIES

Values of critical facilities should be available from the jurisdiction or from HAZUS. Use the same methodology described in *Section D1*, above to calculate annualized loss for critical facilities.

F1. VULNERABLE POPULATIONS

The 2010 census data includes data that can be applied to societal risk. Since the hazard is uniform across the area, the entire population is at risk.

PART 2 – PROPERTY/POPULATION EXPOSURE FOR NON-UNIFORM HAZARDS

D2. BUILDING STOCK EXPOSURE

For hazards that are not uniform across the jurisdiction and instead occur in specific areas (e.g. flooding, wildfire, landslide, dam failure, hazardous material incidents, and possibly severe weather depending on the jurisdiction) the hazard risk area must factor into loss estimation calculations. Using GIS, the hazard risk area should be intersected with the parcel data available from the Montana Department of Revenue's Cadastral Mapping Program.

To calculate the building stock exposure in the jurisdiction that is exposed to the hazard, download the appropriate parcel data from the Cadastral Mapping Program and using GIS, intersect it with the hazard layer (available from NRIS – see Part 1). This methodology should be used to determine the number of buildings (residential or "other") within the hazard area.

Note: Because buildings are not geo-referenced within the parcel, you should assume that any parcel intersected by the hazard layer includes all the buildings located in that parcel. This is a data limitation of this methodology because number of and value of building stock at risk may be over-reported in counties with large parcel sizes.

E2. CRITICAL FACILITY VULNERABILITY

If the jurisdiction has spatial coordinates and values for its critical facilities then exposure can be determined for each hazard. Use the same methodology described in *Section D2*, above to intersect the critical facility locations with the hazard layer to determine exposure (value and number of critical facilities at risk).

For hazards without property damage, this is as far as you can go. Without hazard "magnitude" you are only able to determine building stock or population exposure. Annual loss estimates cannot be calculated without damage data using this approach. For hazards with property damage values, go to **Part 3**.

F2. VULNERABLE POPULATIONS

Data from the 2010 U.S. Census can be applied to societal risk. To calculate the population in the jurisdiction that is exposed to the hazard, download the appropriate census block data (listed below) and using GIS, intersect it with the hazard layer (available from NRIS – see Part 1). Download the census data from

(ftp://ftp.gis.mt.gov/CensusData/CensusBlocks2010 ByCounty/Census2010 All Montana Blocks.zip).

Note: Because populations are not geo-referenced within the census blocks, you should assume that any census block intersected by the hazard layer includes all the people living in that census block. This is a data limitation of this methodology because number of people at risk may be over-reported in counties with large census blocks.

PART 3 - ANNUALIZED PROPERTY LOSS CALCULATIONS WHERE PROPERTY DAMAGE IS AVAILABLE

D3. ANNUALIZED PROPERTY LOSS – BUILDING STOCK

The following equation is used to develop annualized property loss for hazards where there is property damage that can be used to calculate magnitude. Apply the following formula:

- Building Stock value in hazard area x Frequency x Magnitude
- Example: \$315,226,000 x 1.6 x 0.00318% (aka 0.0000318) = \$1,604

E3. CRITICAL FACILITY VULNERABILITY

Critical facility data should be available from the jurisdiction and can be used to compute annualized loss using the same methodology described in *Section D3*, above.
