9.	Here are some things that people hav you say whether you agree or disagre card to pick your answer.	ve said ab e with eac	out Conc ch one u	orde; wising this	ould s		
		Agree strongly	Agree a little		Disagree a little	Disagree strongly	
i	Concorde is a bad investment. It has cost too much to develop.	1	2	3	4	5	(49)
ii	You can have too much speed; ordinary planes are quite fast enough and Concorde is unnecessary	1	2	3	4	5	(50)
ii	It was unfair to spend so much tax- payers' money on Concorde because it benefits only the very wealthy	1	2	3	4	5	(50)
iv	Concorde is so noisy that, if the authorities were serious about cutting down aircraft noise, they would not have let it go into						(51)
v	service. Concorde pollutes the atmosphere	1	2	3	4	5	(52)
/i	more than other planes Concorde should have the same	1	2	3	4	5	(53)
1	freedom to fly as other planes	1	2	3	4	5	(54)
	If Concorde had bren built not by Britain but by the United States I would be less in favour of it.]	2	3	4	5	(55)
i	There's nothing wrong with Concorde and the British should be proud of the fact that they have given it to the world	1	2	3	4		
×	The Americans have no good reason for restricting Concorde; they are doing so out of jealousy	1	2	3	4	5	(56) (57)
×	Every British person has a duty to support Concorde fully	1	2	3	4	5	
1	Concorde is worth developing even if it is only wealthy business men who can afford to fly in it	1	2	3	4	5	(58) (59)
i	The cost of Concorde has been more than its worth	1	2	3	4	5	
i	Concorde represents the kind of exciting, modern progress that should be encouraged at all costs.	1					(60)
	should be encouraged at all costs.	1	2	3	4	5	(6

Jean like,

In order to produce results for the population of the area as a whole, quite heavy definitions will have to be applied, as follows:

 To connect for the fact that the sample was of individuals selected from addresses which were themselves selected with equal propability, each individual interviewed should be werghted by the hubber eligible for interview in his nousehold, i.e. the number used by on card 1, col.17. VITE

If there is no information (cose 0), I suggest you weight by **2.2** (the merage number of adults per household).

- 2. To correct for the fact that we serve gives this the opportunity of selection than men were given, comen should be weighted by 0.5 (or wen by 2).
- Jo correct for the disproportionate selection of autresses within different sampling bands, the following unights should be applied to those within each band. (The three digit band numbers are on concl), cols.11-13).

REACTIONS TO CONCORDE FLIGHTS BY HEATHROW RESIDENTS¹

Aubrey Mc Kennell

Social Science Faculty University of Southampton, Hampshire England

Although drawing on well-tried procedures for surveying aircraft noise annoyance, this survey breaks new ground in that there appears to be no precedents for trying to isolate the effects of a single aircraft type from the totality of aircraft movements round a busy airport

Over 2500 residents living near Concorde flight paths were interviewed between November and December, 1976 Radar tracks provided by the Civil Aviation Authority of actual Concorde flights were used in drawing the sample The entire area within a 10 mile radius of Heathrow was covered, sub-regions being drawn systematically in proportion to both their population density and proximity to the nearest (average) Concorde flight track Residents selected were interviewed at home by professional interviewers Extensive measurements of noise exposure both for Concorde and subsonic aircraft were made along a variety of parameters for each address in the sample 2

DISTURBANCE AND ANNOYANCE FROM CONCORDE

Nearly half the sample (N=1156) lived within half a kilometer of the nearest Concorde flight path, and of these 85% said Yes to the Question (Q 34a) "Have you heard Concorde fly by here" This percentage dropped gradually with distance until at over 4 kilometeres only 24% answered Yes to Question 34a For the same question analysed by Average Peak PNdB of Concorde it was found that only 30% of those (N=302) at 94PNdB or below said Yes, jumping to 70% for those (N=231) between 95-99PNdB and thereafter clumbing slowly to reach 94% for those (N=322) overflown by Concorde at or above 120 PNdB In total the 'heard-Concorde' group (N=1975) constituted 75% of the sample Analysis of measurement data showed for most households that at about 90PNdB Concorde tended to be louder than subsonic aircraft in the same locality, and increasingly so as levels increased

A scale of annoyance caused through activities disturbed by

Concorde was constructed, and used in most applications in the four categories shown in Table 1 The scale itself gives a higher correlation (.26 as against 22) with Concorde noise levels than do simple self-ratings of annoyance But, in broad terms, those scoring three or more on the scale rate themselves 'very annoyed' by Concorde overflights, those scoring two either's little' or 'moderately annoyed', those scoring one only 'a little annoyed', and zero 'not at all annoyed'

Table 1. Annoyance caused through activities disturbed by Concorde

		Averag	e Peak	PNdB -	Concord	le	
		104	105-	110-	115-	120	Total
			109	114	119		
		7.	7.	7	7	7,	7 7
Concorde	0	76	66	71	65	39	64
Annoyance	1	15	17	14	18	24	18
Scale	2	6	11	8	9	20	1 11
	3	3	6	. 7	8	17	7
	Total	100	100	100	100	100	100
	(Base)	(451)	(596)	(322)	(304)	(302)	(1975)

The incidence of specific disturbances increased minimally over intermediate Concorde noise levels and then markedly at or above 120 PNdB, as do the annoyance scores Taking the same five PNdB categories shown in Table 1, the percentages reporting house vibration from Concorde were respectively 16, 26, 19, 25 and 51 (averaging 27% in total), and the comparable percentages for reports of interference with conversation were 15, 30, 24, 30 and 51 (average 29) The percentages reporting vibration and conversation interference from subsonic aircraft were higher, averaging 57% and 68% respectively Considering only the relative magnitude of the two types of effect, it was concluded that Concorde differs from subsonic aircraft in that vibration effects are almost as important as speech interference as a source of disturbance

Physical Exposure Correlates of Concorde Annoyance The choice of Average Peak PNdB as the exposure variable was made only after extensive analysis of the noise measurement data Work by John Large² produced some 60 parameters for each address in the sample The three different time periods that were considered (NNI period 'Last Month' and Overall') produced highly intercorrelated sets of data After using factor analysis to check for further internal redundancy the 60 parameters were reduced to 20. The final step was to run correlations for each of the twenty physical variables against the questionnaire measure of Concorde annoyance Average PNdB was chosen as the best single predictor on the basis of these results Combinations of parameters that were tried failed to produce any correlations that were superior

574

BIAS VERSUS SENSITIVEN IN REACTIONS TO CONCORDE NOISE

Factor analysis of a battery of opinion items about Concorde produced a two-item scale measuring the degree of patriotic involvement with the plane (e.g. "Every British person has a duty to support Concorde fully") A scale of annoyance from aircraft in general was constructed exactly as in previous Heathrow surveys These variables, patriotism and annoyance, had by far the highest correlations with the Concorde annoyance scale (42 and 30 respectively) out of the many others examined in the study А distinction can be drawn between "sensitivity" defined by the slope of the regression line relating scores on the Concorde annoyance scale to its PNdB levels, and "bias" which is a function of the height of this line For respondents divided into three groups according to whether they scored High, Medium or Low on the general annoyance scale, the regression slopes were 03, 01 and 004, respectively, whereas for those scoring High, Medium and Low on the patriotism scale the slopes were almost equal at 02, 02 The latter regression lines thus ran almost parallel and 03 although they were displaced laterally one above the other, whereas the former tended also to fan out Levels of annovance with aircraft in general, then, are related to sensitivity as well as bias, while the patriotism variable is an example of an almost pure biasing factor Other examples will be given, but to show briefly the extent of this bias on reported annoyance, consider the results for those (N=472) scoring "Low" on the patriotism scale, for the same five PNdB categories shown in Table 1 the percentages of this subgroup scoring 3 on the Concorde annovance scale were 11, 10, 15, 18 and 30 (comparable to 3, 6, 7, 8 and 17 in Table 1)

The factors making for blas and sensitivity can obviously vary between one noise exposed community and another, and need to be taken into account accordingly

CONCORDE VERSUS OTHER AIRCRAFT TYPES

Early in the questionnaire, before Concorde had been mentioned by the interviewer, respondents were asked (Q 22) "Is there any one type of aircraft that is more annoying than others when if flies by here?" Fifty-mine percent of the heard-Concorde group (N=1975) were able to name an aircraft type Eighteen per cent named the VC10, 15% the Trident and 12% Concorde However, among the Low Patriotism subgroup (N=472) these percentages were respectively 17, 11 and 22 Later, at Question 26, respondents were presented with a list of aircraft types and asked to select, among other things, the one that makes the most disturbing noise The results were very similar. The incidence of mentions ran a percentage or two higher, but the rank order for VC10, Trident and Concorde was the same in the total sample, with Concorde again moving into first place among the Low Patriotic segment

DISTURBNCL, LOUDNESS AND DURATION

After picking out then use list the aircraft type judged

most disturbing (Q 26e), respondents were asked to select one which made the loudest noise (Q 26f) Some 34% selected Concorde as the loudest aircraft compared with only 14% who selected it as the most disturbing A significant segment of those who had heard Concorde were therefore saying, in effect, that while Concorde was the loudest aircraft it was nevertheless not the most disturbing Patriotic bias being suspected, this segment was broken out and (along with other loudness/disturbance combinations) crosstabulated against the patriotism scale

While the Loudest and the Most Disturbing judgements were on their own greatly influenced by patriotism, the relative judgement loudest-but-not-the-most-disturbing was remarkably independent (at 227 in all three segments of the patriotism scale) Α more objective source seemed indicated Similar analyses of the incidence of this relative judgement revealed that, while largely independent of intermediate Concorde noise levels, it tended to increase at the very highest levels A clue to the explanation was provided when respondents were asked (Q 26c) to select from the list the plane type for which the noise is "gone Fifty-two per cent selected Concorde, no other airquickly" craft being selected by more than 8% Further analysis showed that these 52% lived mainly in regions where the duration of Concorde noise (10dB down from the peak) was shorter than that of subsonic aircraft, these being mainly regions where its noise level exceeded 110 PNdB Moreover those respondents (N=790) who said that Concorde was less disturbing than other aircraft (at were also found on analysis to live in similar Question 36) Three quarters of this latter group, asked why they regions thought this, replied that it was because Concorde "goes over Several lines of evidence thus indicated that without quickly" the ameliorating effect of its shorter duration, the loudness levels reached by Concorde would generate even more annoyance and disturbance than they in fact do

APPREHENSION VERSUS ACTUALITY IN REACTIONS TO CONCORDE NOISE

Heathrow residents were subjected to a heavy barrage of publicity about Concorde, and its noise, before they actually heard the plane fly In the light of this their replies to Question 37, shown in Table 2, were of special interest

Table 2 Analyses of Question 37 "Is the noise of Concorde more disturbing, or less disturbing than you thought it would be?"

		Concorde not-heard			
	Hıgh	Medium	Low	Total	
	7.	7	7.	z	7.
More than thought	4	7	19	9	5
Less than thought	73	64	47	63	30
Same as thought	19	23	26	23	20
Don't know	4	6	8	5	45
Total	100	100	100	100	100
(Base)	(605)	(898)	(472)	(1975)	(652)

Pilot work had shown that this was a question well understood by Heathrow residents It was asked towards the end of the main questionnaire when it became apparent to the respondent that the interview was about Concorde Nevertheless tabulation against the patriotism scale revealed only a mild trend, as shown in Table 2. The trend with Concorde noise level was similarly mild Neither trend was sufficient to upset the apparently firmly grounded judgement of those Heathrow residents who had heard Concorde that its noise was less disturbing than they had been led to expect On the basis of these results, writing in March 1977, it was suggested "that a similar distribution of opinion would, after a time, be found at Kennedy, were Concorde allowed to fly there"

DOES CONCORDE ADD TO TOTAL NOISE ANNOYANCE?

The question arises because the impact of Concorde's scheduled operations on the total noise annoyance round Heathrow is likely to be small simply because the frequency of these operations is small At the time of the survey few residents were in a position to hear more than four Concorde flights per week Possibly because of this, no relationship could be found between counts of the number of Concorde flights in any locality and the level of annovance with the plane After careful consideration it was felt that, however suggestive, the significant relationship with Concorde noise levels that was found (as discussed above) could not be produced on its own as evidence of the scale of The relationship uncovered is perhaps a testi-Concorde's effect mony to the precision of the investigation, but a persistent critic could well take the line that with adequate instrumentation even the impact of a drop falling into an ocean can be measured It could likewise be argued that replies about Concorde's noise would tend to focus round the experience of a single overflight, whereas the frame of reference for subsonic aircraft would integrate large numbers of flights Initially it was hoped that a yardstick might be provided by scoring reactions to all aircraft on an identical scale to that used to measure Concorde annoyance For example, some 20% of respondents at the highest Concorde noise levels reported serious annoyance on the Concorde annoyance scale compared with 50% yielding similar scores at the highest subsonic levels on the scale for general aircraft annoyance For the reasons above it was felt that in the absence of good supporting evidence such comparisons would have only dubious validity as an index of the relative seriousness of Concorde annoyance

Other lines of evidence examined included data from the earlier part of the questionnaire designed to measure the 'salience' of noise disturbance (e g "What are the things you don't like about living round here?") These questions each produced substantial percentages of spontaneous mentions of aircraft noise, inreasing systematically with noise level. But no more than a handful of respondents mentioned Concorde specifically at this point These results seemed sufficient to refute the extreme position, should anyone wish to maintain it, that Concorde dominated the noise environment, or was overwhelming as a source of disturbance

At the other extreme, the question of whether Concorde made an appreciable or even detectable increment to the total level of aircraft annoyance still remained open A multiple regression approach was tried in which a measure of annoyance from the questionnaire was first regressed on a measure of Average Peak PNdB for subsonic aircraft as a predictor, and then again using both the latter and a measure of Concorde PNdB as joint predictors The multiple correlation moved from 31 to 32 Other data indicated that this small increment was of the same order of magnitude as the error in our measuring instruments In this situation it was felt that the measurement and mathematical varies of the multiple regression statistics rendered it too frail a peg on which to hang a conclusion of any importance The British Civil Aviation Authority had concluded on the basis of NNI calculations (CAA Paper 77007) that any impact of Concorde was on the borderline of detectability The NNI logic is in itself questionable, especially when extrapolated to the effects of a few, widely spaced and exceptionally noisy overflights But given the uncertainties noted above it seemed only proper to accept that the survey data could not be brought to bear conclusively either way, to prove or disprove the inferences drawn by the CAA from the NNI computations

1 This study was designed and directed by Aubrey McKennell acting as an independent consultant under contract to the Port Authority of New York and New Jersey commencing in October 1976 The final report was completed in March 1977. Under separate contracts, the fieldwork and data processing were carried out by Social and Community Planning Research, London, the basic noise data were supplied by the British Civil Aviation Authority and was reworked by Jonn Large, assisted by J E Ludlow, in a form suitable for the survey

The derivation and internal analysis of the noise data, a considerable operation in its own right, was reported on separately by Large and Ludiow Only reference copies are currently available (IS V R Memoranda Numbers 578 and 579) Full-length articles based on the measurement and survey reports are to be published in the Journal of Sound and Vibration
