		Documenting Software Architectures
Conceptual Architecture v	s. Programmi	ing Model: Example II
• A component:		
<pre>public @component class AddressManager implements IAddressStore (// provides Ad private IPersonDAO personDAO; public @resource void setPersonDAO (IPer this.personDAO = d; // setter for }</pre>	rsonDAO d) { or dao	
<pre>public void addOrUpdateContact(Person p // from IAddress</pre>		• A process comp't:
<pre>} public void addAddress(Person p, Addre // from IAddres public Address[] getAddresses(Person p // from IAddres } </pre>	<pre>private ICustomerManagg public @resource void ICust this.custMgr = mgr; } public @trigger void p PaymentProcessInstan if (amountCorrect() // advance to anot: } public @trigger void p</pre>	<pre>ts IPaymentProcessTrigger { er custMgt; setCustomerManager(omerManager mgr) { aymentMade(int procID) { ce i = loadProcess(procID);) { her state aymentTimeout(int procID) { ce i = loadProcess(procID); }; </pre>

Documenting Software Architectures
What needs to be documented?
Conceptual level:
 The conceptual architecture
 Stakeholders and their needs
 Rationales why the conceptual architecture is as it is
• The programming model
 The technology mapping
• Application Level:
 The application architecture
 Stakeholders and their needs
 Rationales why the application architecture is as it is
 We will focus mainly on the conceptual level

Documenting Software Architectures		
Glossary Example		
Data type	Represents a certain chunk of data. Data types can either be simple types (string, int, boolean and the like) or <i>Complex Types</i> .	
Complex Typ	e A complex data type is basically a like a struct in that it has named and typed attributes. There are two kinds of complex data types: <i>Entities</i> and <i>Data Transfer Objects</i>	
Entity	persistent entities that have a well-defined identity (and can thus be searched), and that can have relationships to other entities.	
Data Transfe Object	r Data transfer objects have no identity and are not persistent.	
Interface	A contract that contains a number of operations; operations are defined in the usual way (parameters, return type, exceptions)	
Component	A component is a well-defined piece of behaviour. It does not implement technical concerns. Each component can provide a number of $lnter/laces$. It can also use a number of interfaces (provided by other components). Components are stateless (i.e. cannot "remember" things from one invocation to another)	
Process	We also explicitly support business processes. These are considered to be expressable as state machines. Components can trigger the state machine by supplying events to them. In turn, other components can be triggered by the state machine, resulting in the invocation of certain operations defined by one of their provided interfaces.

Documenting Software Arc	hitectures
Architectural Patterns / The Pipes and Filters Pattern	n II
Consequences:	
 + No intermediate files necessary, but possible + Flexibility by filter exchange or recombination + Reuse of filter components + Rapid prototyping of pipelines + Possibility of improved efficiency by parallel processing 	
 Shared state may be expensive and complicated Possible data transformation overhead Error Handling

Documenting Software Architectures
Diagrams
• Definition I: (en.wikipedia.org/wiki/Diagram) A diagram is a simplified and structured visual representation of concepts, ideas, constructions, relations, statistical data, anatomy etc used in all aspects of human activities to visualize and clarify the topic.
• Definition II: (careers.ngfl.gov.uk/help/definitions/14_2_image.html) Diagram means a graphical or symbolic representation of something, usually showing the relationship between several items.
• Definition IIII: (www.evgschool.org/Columbus%20vocabulary.htm) A diagram is a drawing, sketch, plan, or chart that helps to make something easier to understand

o-it-yourself vs. Standard	umenting Softwa	re Architectures
Comparison Criterion	DIY (DSL)	Standard (UML,ADL)
Tool Support	0	+
Task-Specificness (Modeling Efficiency)	+	-
Adaptability (your architecture changes – what do you do?)	+	0
Suitable for Generation (meta model complexity and comprehensibility)	+	0
Learn-your-domain (defining a meta model helps you understand your own domain)	+	-
Learning overhead (learn the language in order to use it)	-	0
Communicate with outsiders (who might not want to learn your language)	-	+
