## Joint Doctrine for Offensive Operations for Countering Air and Missile Threats

NOTICE:

Draft Publications do not represent official

Final Coordination  
19 August 2002

## PREFACE

### 1. Scope

~~This publication provides the guidance necessary to conceptualize, plan, coordinate, and conduct successful offensive counterair operations throughout the range of military operations. This publication builds upon the foundation of joint doctrine in JP 3-01, *Joint Doctrine for Countering Air and Missile Threats*, and provides more detailed guidance on the planning and conduct of offensive operations designed to counter adversary forces attempting to attack US forces or interest with air and/or missile assets.~~

### 2. Purpose

This publication has been prepared under the direction of the Chairman of the Joint Chiefs of Staff. It sets forth doctrine to govern the joint activities and performance of the Armed Forces of the United States in joint operations and provides the doctrinal basis for US military involvement in multinational and interagency operations. It provides military guidance for the exercise of authority by combatant commanders and other joint force commanders (JFCs) and prescribes doctrine for joint operations and training. It provides military guidance for use by the Armed Forces in preparing their appropriate plans. It is not the intent of this publication to restrict the authority of the JFC from organizing the force and executing the mission in a manner the JFC deems most appropriate to ensure unity of effort in the accomplishment of the overall mission.

### 3. Application

a. Doctrine and guidance established in this publication apply to the commanders of combatant commands, subunified commands, joint task forces, and subordinate components of these commands. These principles and guidance also may apply when significant forces of one Service are attached to forces of another Service or when significant forces of one Service support forces of another Service.

b. The guidance in this publication is authoritative; as such, this doctrine will be followed except when, in the judgment of the commander, exceptional circumstances dictate otherwise. If conflicts arise between the contents of this publication and the contents of Service publications, this publication will take precedence for the activities of joint forces unless the Chairman of the Joint Chiefs of Staff, normally in coordination with the other members of the Joint Chiefs of Staff, has provided more current and specific guidance. Commanders of forces operating as part of a multinational (alliance or coalition) military command should follow multinational doctrine and procedures ratified by the United States. For doctrine and procedures not ratified by the United States, commanders should evaluate and follow the multinational command's doctrine and procedures, where applicable and consistent with US law, regulations, and doctrine.

For the Chairman of the Joint Chiefs of Staff:

JOHN P. ABIZAID  
Lieutenant General, USA  
Director, Joint Staff

## EXECUTIVE SUMMARY

### COMMANDER'S OVERVIEW

- Discusses Offensive Counterair (OCA) Operations and its Relationship to Defensive Counterair Operations
  - Provides Command and Control (C2) Relationships and Service C2 Systems for OCA Execution
  - Discusses Fundamentals for Planning OCA Operations
  - Discusses Fundamentals for Executing OCA Operations
- 

### Overview of Offensive Counterair

*Offensive counterair (OCA) operations are conducted at the initiative of friendly forces.*

**Offensive counterair (OCA) seeks to dominate the adversary's airspace and prevent the launch of air and missile threats.** OCA consists of offensive measures to destroy, disrupt or neutralize adversary aircraft, missiles, launch platforms and their supporting structures and systems. Ideally, joint OCA missions will prevent the launch of aircraft and missiles by destroying or neutralizing them prior to launch. **Those weapons that are launched should be destroyed or neutralized as close to their source as possible.**

OCA and defensive counterair operations need to be synchronized and integrated to achieve unity of effort for theater- and/or joint operations area-wide counterair.

### Command and Control of Offensive Counterair

*As the supported commander, the joint force air component commander normally exercises operational control over assigned and attached forces and tactical control over sorties from other components.*

The joint force commander (JFC) normally designates the joint force air component commander (JFACC) as the supported commander for counterair. Though the JFC determines the command and control (C2) relationships within the joint force, typically, the JFACC (a Service component commander) will exercise operational control over assigned and attached forces and tactical control over military capability or forces made available for tasking from other components. Surface forces will normally provide fire support, and attack helicopters may be provided in direct support. Each Service has tactical C2 nodes that can execute OCA operations. Close coordination

between components is necessary to effectively plan and execute OCA operations.

*Multinational considerations examine the capabilities of partners to ensure assigned tasks enable partners to make a contribution to the OCA mission.*

**In multinational operations**, the Combined Joint Force Air Component Commander (CJFACC) must consider a number of factors such as force capabilities, information and equipment security levels, and procedural and organizational differences of multinational partners. **The CJFACC should ensure that all elements can make meaningful contributions to the overall counterair mission.**

## Planning Offensive Counterair Operations

*The joint intelligence preparation of the battlespace for OCA involves information about the adversary's capability to employ airpower. This information is used to develop our joint air operations plan which includes OCA.*

**The joint intelligence preparation of the battlespace provides the basis for support to the course of action** selected by the JFC. For OCA, **this involves any information about the adversary's air and missile threat capability, such as types of weapons systems and operating bases, locations, and the supporting infrastructure, such as air defense radars, communications facilities or C2 nodes.** This type of information is used in the development of the joint air operations plan, a six-step process that involves **strategy-to-task methodology and helps to produce a master air attack plan**, the basis for the air tasking order.

*OCA may require either positive or procedural airspace control measures.*

**Other important considerations in planning OCA are airspace control** (required to execute OCA), **rules of engagement** (determines options, targets and methods), and **identification** (to avoid fratricide).

*Air refueling, space, information and special operations all enable effective OCA operations.*

**There are also operations which enable OCA. Air refueling** extends the range of OCA platforms. **Space operations** provide intelligence, communications, weather and global positioning, navigation and timing to support OCA. **Information operations** are used to provide information about the adversary and misinformation to the adversary. **Special operations** direct action missions are often integrated into OCA attack operations, such as those to destroy a mobile missile launcher or C2 node.

## Executing Offensive Counterair Operations

The primary OCA missions are: OCA attack operations, fighter sweep, fighter escort and suppression of enemy air defenses (SEAD).

**Attack operations** are conducted against surface targets and attempt to **destroy or neutralize aircraft or missiles before**

they are launched. Attack operations also target support mechanisms such as C2 nodes, communications facilities, airfields, aircraft shelters, etc. Attack operations can be preplanned or immediate. The JFACC has many options in terms of resources for attack operations. Aircraft can be used where flexibility is required. Surface-to-surface missiles can be used in high risk areas. Where range permits, artillery and naval surface fire may be used to support attack operations.

*Sweep and escort missions normally require fixed-wing assets.*

**Fighter sweep and fighter escort are air-to-air missions normally conducted over the adversary's airspace.** Fighter sweep seeks out and destroys adversary aircraft and missiles within a defined volume of airspace. **Fighter escort is normally flown to provide protection from aerial attack** for a group of aircraft en route to/from a target area, or to protect high value airborne assets such as search and rescue or special operations forces aircraft.

*Suppression of enemy air defenses is an OCA mission that disrupts or destroys adversary Integrated Air Defense System to enable freedom from attack over adversary airspace.*

**SEAD focuses on destroying or disrupting or degrading the adversary's surface based air defenses to enable friendly air operations over the adversary's airspace.** It can be **theater wide** (affecting the adversary's Integrated Air Defense System) **localized** (focused on a particular air defense node such as electronic warfare radar) or **opportunistic** (target of opportunity). Destructive SEAD can be accomplished by both airborne and surface based weapons systems that can effectively target air defense systems. Disruptive SEAD temporarily denies or degrades air defense systems and is normally accomplished by an airborne jamming platform, or the use of expendables such as chaff, flares and decoys.

## CONCLUSION

This publication provides the guidance necessary to conceptualize, plan, coordinate, and conduct successful OCA operations throughout the range of military operations.

Intentionally Blank

# CHAPTER I

## INTRODUCTION

*World War II: Normandy*

*"If I didn't have air supremacy, I wouldn't be here."*

**General Dwight Eisenhower,  
(Surveying the buildup area at Normandy, late June 1944.)**

### 1. The Counterair Framework

a. The purpose of the joint counterair mission is to attain the desired degree of air superiority to allow freedom of action and to protect the joint force. To execute this mission, joint force commanders (JFCs) integrate the capabilities of each component to conduct offensive and defensive operations. Offensive counterair (OCA) operations seek to dominate ~~the adversary's~~ airspace and prevent the launch of threats, while defensive counterair (DCA) operations defeat adversary air and missile threats attempting to attack or penetrate friendly airspace. Note in Figure I-1 that while electronic warfare (EW) is not identified as a specific mission, it is a great enabler of both OCA and DCA.

Joint counterair missions may employ aircraft, surface-to-air missiles (SAMs), surface-to-surface missiles (SSMs), artillery, special operations forces (SOF), ~~or~~ and elements of information operations (IOs) against a variety of threats. These threats include ~~enemy~~ adversary aircraft and aerial platforms (manned or unmanned), ballistic missiles, cruise missiles (air, land, or sea launched) and air-to-surface missiles.

b. Counterair operations usually begin early in the conduct of joint operations, and their effects produce the desired degree of air superiority at the time and place of the JFC's choosing. Air superiority may not totally eliminate air and missile opposition. However, it limits

~~the adversary's~~ ability to conduct air and missile attacks and surveillance while providing a more favorable environment for joint forces to perform their tasks without prohibitive interference from adversary attacks. Air superiority may vary over time and geography. The degree of air superiority required depends on the overall situation and the JFC's concept of operations (CONOPS).

### 2. Focus of Offensive Counterair

a. OCA operations are the preferred method of countering air and missile threats. OCA consists of offensive measures to destroy, disrupt, or neutralize adversary aircraft, missiles, launch platforms, ~~anti-aircraft artillery~~ and their supporting structures and systems both before and after launch, but as close to the source as possible. OCA targets are those which directly or indirectly enable adversary airpower and can include petroleum, oils, and lubricants facilities, aircraft repair structures, command and control (C2) facilities, etc. Ideally, joint OCA operations will prevent the launch of or destroy adversary aircraft and missiles ~~by destroying them~~ and their supporting infrastructure prior to launch. OCA includes:

- **Attack Operations.** Targeting all adversary air and missile forces and the surface elements that contribute to ~~their adversary's air and missile~~ capability.

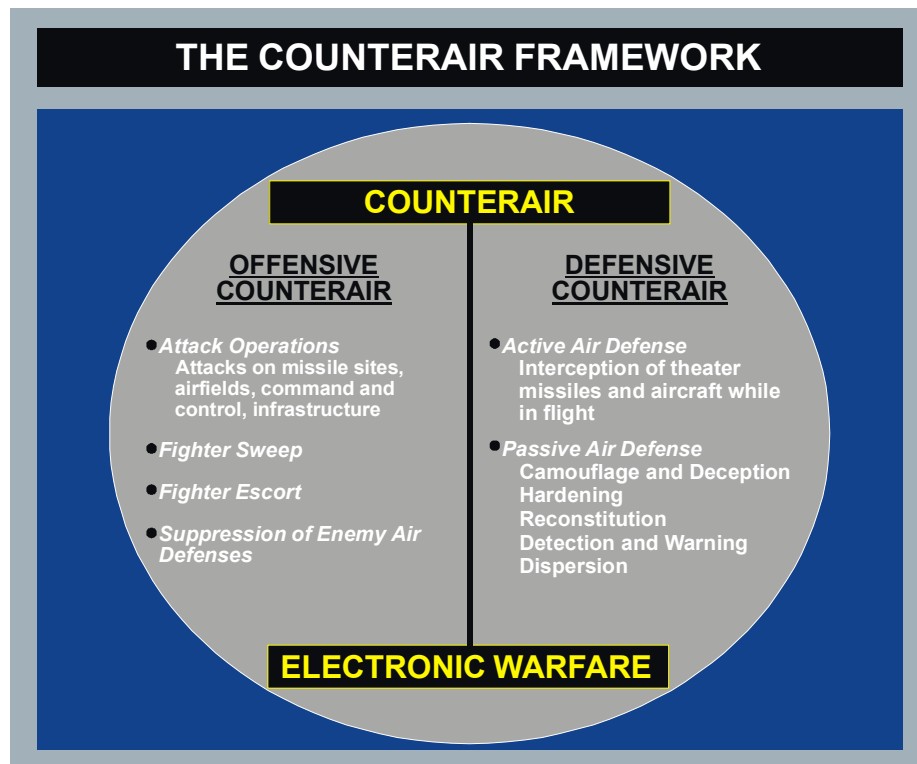

Figure I-1. The Counterair Framework

- 1 • **Fighter Sweep.** Seeking out  
2 ~~airborne adversaries~~ adversary  
3 aircraft or targets of opportunity for  
4 destruction in an allotted area of  
5 operations.
- 6
- 7 • **Fighter Escort.** Providing protection  
8 ~~to sorties in support of other offensive~~  
9 air and air support operations over  
10 adversary territory or in a defensive  
11 counterair role to protect aircraft such  
12 as high value airborne assets  
13 (HVAA~~s~~) or close air support (CAS)  
14 ~~packages~~ missions.
- 15
- 16 • **Suppression of Enemy Air Defenses**  
17 **(SEAD).** Disrupting or destroying  
18 surface-based enemy air defense  
19 systems.  
20

21 Further discussion of each of these  
22 missions can be found in Chapter IV,  
23 “Offensive Counterair Execution.”  
24

25 b. OCA operations are high priority as  
26 long as the adversary has the air and  
27 missile capability to threaten friendly  
28 forces and conduct aerial surveillance.  
29 This publication expands on the  
30 information in Joint Publication (JP) 3-01  
31 Joint Doctrine for Countering Air and  
32 Missile Threats, by focusing on OCA  
33 operations. This publication includes C2,  
34 planning, and execution of OCA  
35 operations.

### 36 37 38 3. Synchronization and 39 Integration of ~~OCA~~ 40 Offensive Counterair and 41 Defensive Counterair<sup>A</sup>

*OCA and DCA operations provide the freedom from attack, freedom to maneuver, and the freedom to attack.*

- ~~a. OCA and DCA are complementary operations. They provide the freedom from attack, freedom to maneuver, and the freedom to attack necessary for success in air, land, naval, space or special operations. Considerations for integrating and synchronizing OCA and DCA are:~~
- ~~• The relationship between OCA and DCA is situation dependent. Under some circumstances OCA operations may be predominate under others; particularly military operations other than war, DCA may be used exclusively.~~
  - ~~• A single commander with an adequate C2 system is responsible for planning and executing both OCA and DCA operations. If properly organized and established this C2 system should be able to seamlessly flow assets from one mission to the other based upon the mission, phase and changing daily requirements to support the JFC and his scheme of maneuver and fires.~~
  - ~~• OCA and DCA operations should maximize the strengths and minimize~~
- ~~vulnerabilities of each type of operation.~~
- ~~b. Synchronization, integration and unity of effort between OCA and DCA operations are facilitated by the use of many of the same sensors, weapons, and C2 systems. Timely exchange of information, in addition to situational awareness, interoperability among C2 and intelligence nodes, and decision support tools facilitate seamless connectivity between commanders and components.~~
- ~~c. Interoperable systems facilitate centralized planning and decentralized execution. Architecture is a critical element in OCA/DCA synchronization and integration. Command, control, communications, computers, and intelligence (C4I) systems meld communications, sensors, automation, and intelligence with decision makers, operators, and weapons throughout the battlespace. They enable the joint force to simultaneously detect adversary aircraft, theater missiles, and air defense targets; to warn friendly forces; and to rapidly react to neutralize or destroy the threat.~~

## Chapter I

OCA and DCA are mutually supporting operations, which provide the freedom from attack, freedom to maneuver and the freedom to attack necessary for success in air, land, sea, or space special operations. Close coordination between joint commanders and early campaign planning are required to integrate both operations.

a. Before counterair (CA), joint theater missile defense (JTMD) (previously covered in JP 3-01.5, *Doctrine for Joint Theater Missile Defense*) was the significant air doctrine that closely synchronized the attack with the defense. While JTMD is an integral part of CA, detailed missile defense planning to counter this specific threat is often necessary to properly synchronize and integrate the two efforts and their operational elements. The overall CA tenets of centralized planning and decentralized execution of OCA/DCA operations continue to remain key.

- In addition to passive and active defense, JTMD incorporates planning and C2 actions to facilitate OCA attack operations. **Preemptive destruction of theater missiles (TMs) especially provides greater force protection than engaging them in flight.** While these attacks are accomplished via offensive air or land force fires and maneuver, **the purpose is defensive and these attacks must be planned and synchronized with the overall DCA scheme to maximize the effectiveness of resources.**

- Considerations for integrating and synchronizing OCA and DCA:

- The relationship between OCA and DCA is situationally dependent. Under some circumstances OCA operations may be predominant,

under others, particularly military operations other than war, DCA may be used exclusively.

- A single commander with an adequate C2 system is responsible for planning and executing both OCA and DCA operations. If properly organized and established, this C2 system should be able to seamlessly flow assets from one mission to the other based upon the mission, phase, and changing daily requirements to support the JFC and his scheme of maneuver and fires.

- OCA and DCA operations should maximize the strengths and minimize vulnerabilities of each type of operation.

b. Synchronization, integration and unity of effort between OCA and DCA operations are facilitated by the use of many of the same sensors, weapons, and C2 systems. Timely exchange of information, in addition to situational awareness, interoperability among C2 and intelligence nodes, and decision support tools facilitate seamless connectivity between commanders and components.

c. Interoperable systems facilitate centralized planning and decentralized execution. Architecture is a critical element in OCA/DCA synchronization and integration. Command, control, communications, computers, and intelligence (C4I) systems meld communications, sensors, automation, and intelligence with decision makers, operators, and weapons throughout the battlespace. They enable the joint force to simultaneously detect adversary aircraft, TMs, and air defense targets; to warn friendly forces; and to rapidly react to neutralize or destroy the threat.

1  
2 Upon a theater ballistic missile (TBM)  
3 launch, in-theater sensors and other  
4 national assets detect the launch and begin  
5 tracking the adversary missile. These  
6 systems provide near real time ballistic  
7 missile warning, trajectory, launch point  
8 and impact point data to C2 nodes through  
9 the joint theater ground station, the Global  
10 Command and Control System (GCCS)  
11 and Global Broadcast System. After  
12 launch, US Space Command provides  
13 primary TBM warning. Missile warning  
14 infra-red data is processed by the theater  
15 event system which is composed of three  
16 separate, similar, and complementary  
17 ground processing elements which  
18 disseminate data over C2 nodes to tactical  
19 users and also via prearranged voice  
20 networks. Simultaneously, C2 systems  
21 alert friendly forces in the predicted TBM  
22 impact zone. Friendly forces execute  
23 active and passive air defense measures to  
24 counter the threat. A Patriot battery,  
25 which has also been exchanging tracking  
26 surveillance data with an Aegis missile  
27 cruiser through the C4I network, via  
28 tactical digital information link, tracks the  
29 threat and launches a hit to kill missile on  
30 the incoming TBM when it's within  
31 range. Simultaneously, joint force  
32 intelligence, surveillance, and  
33 reconnaissance (ISR) systems are cued  
34 through GCCS to acquire the adversary  
35 launch site. These systems then pass on  
36 fire-control targeting data to a designated  
37 weapons system, which is employed to  
38 destroy the mobile launcher. This  
39 seamless process should be executed in  
40 less than 10 minutes from the TBM

*OCA and DCA operations use many of the same sensors, weapons, and C2 systems.*

41 launch. A similar scenario could apply  
42 to a package of adversary strike aircraft  
43 preparing to takeoff from an adversary  
44 airfield (detected by ISR assets). An OCA  
45 strike against the airfield and aircraft  
46 before they takeoff is the preferred  
47 method. Simultaneously, DCA forces are  
48 alerted of a potential air strike, so friendly  
49 forces can initiate active and passive air  
50 defense measures.

## ~~OCA/DCA COUNTERAIR MISSION SEQUENCE~~

~~The following scenario is an example of the sequence of events occurring during synchronized and integrated offensive counterair (OCA)/defensive counterair (DCA) mission execution:~~

~~Upon an enemy theater ballistic missile (TBM) launch, intelligence, surveillance, and reconnaissance (ISR) assets (to include in-theater, national and Defense Support Program satellites) detect the launch and begin tracking an enemy missile. These systems provide near real time ballistic missile warning, trajectory, launch point and impact point data to counterair command and control (C2) nodes through the theater air-ground system, the Global Command and Control System (GCCS), and Global Broadcast System. Simultaneously, C2 systems alert friendly forces in the predicted TBM impact zone. Friendly forces execute active and passive defense measures to counter the threat. A PATRIOT battery, which has also been exchanging tracking data within the command, control, communications, computers, and intelligence network through the tactical digital information link, tracks the threat and launches a hit-to-kill missile on the incoming TBM when it is within range. Simultaneously, joint force ISR systems are cued through GCCS to acquire the enemy launch site. These systems then pass on critical data to the designated weapons system, which is launched or employed to destroy another mobile launcher which is preparing to launch. Overall, the attack/defend sequence is executed within single-digit single-digit minutes of the TBM launch. A similar scenario could apply to a package of enemy strike aircraft preparing to takeoff from an enemy airfield (detected by ISR assets). An OCA strike against the airfield and the aircraft, before they take off, is the preferred method. Simultaneously, DCA forces are alerted of a potential air strike, so friendly forces can initiate active and passive defense measures.~~

~~VARIOUS SOURCES~~

## CHAPTER II COMMAND AND CONTROL

“Air control can be established by superiority in numbers, by better employment, by better equipment, or by a combination of these factors.”

General Carl A. “Tooey” Spaatz

### 1. General

The emerging capabilities of air and missile threats require joint forces to be more responsive, flexible, and interoperable than ever before. The manner in which JFCs organize their forces directly affects the responsiveness and versatility of ~~joint force operations~~ the counterair forces. The JFCs organize forces to accomplish the mission based on ~~their his~~ vision and ~~concept of operations~~ CONOPS. Unity of effort, centralized planning and decentralized execution are key considerations. Unity of effort is necessary for effectiveness and efficiency; centralized planning is essential for synchronizing and integrating the efforts of all available forces; and decentralized execution is essential to generate the tempo of operations required and to cope with the uncertainty, disorder, and fluidity of combat. The JFC delegates tasks to subordinates to enable effective spans of control, responsiveness, tactical flexibility, and protection.

### 2. Responsibilities and Command Relationships

a. The JFC organizes forces, assigns responsibilities, and establishes command relationships to include supported and supporting relationships and any necessary coordinating instructions. The joint force air component commander (JFACC) is normally the supported commander for counterair which includes both OCA and DCA.  
*Amplifying detail on the command relationships for counterair can be found*

in Chapter II, ~~Joint Publication (JP)~~ 3-01, Joint Doctrine for Countering Air and Missile Threats.

b. Close coordination among component commanders and the JFC is necessary to effectively plan and execute OCA operations and to ensure a synergistic effort. Some OCA operations require short reaction time. In these situations, timely component-to-component coordination is necessary. The JFC may apportion component ~~capability~~ and/or forces to the JFACC to support counterair missions throughout the theater/joint operations area (JOA) ~~wide counterair missions~~. The JFC determines the most appropriate command ~~authority~~ over relationships for forces made available to conduct OCA. The functions of the JFACC, area air defense commander (AADC) and airspace control authority (ACA) must be integrated to ensure that ~~OCA and DCA joint air~~ operations and airspace control are synchronized (see JP 3-01, *Joint Doctrine for Countering Air and Missile Threats*, for a description of the functions of the JFACC, AADC, and ACA). The responsibilities of the JFACC, AADC, and ACA are interrelated and are normally assigned to one individual, but they may be assigned to two or more individuals when the situation dictates. Based on the situation, if the JFC decides not to assign the responsibilities of JFACC, AADC, and ACA to one individual, then close coordination between all three positions is essential. ~~Typically, the JFACC exercises operational control (OPCON) over assigned and attached forces and tactical~~

## Chapter II

The ~~BGD~~-AWACS assists in the synchronization of joint air operations.

~~control over sorties made available from other components. Surface forces provide fire support while attack helicopters may be placed in a direct support role. Typically for OCA, air and naval forces provide air sorties tactical control, and surface forces provide fire support and attack helicopters in direct support.~~

c. The joint air operations center (JAOC) serves as the command center for the JFACC and is the focal point for OCA operations. Refer to JP 3-30, Command and Control for Joint Air Operations, for more detailed information. The following describes elements of the component C2 systems used for OCA operations.

- **Air Force Theater Air Control System (TACS).** The Air Force TACS provides a C2 infrastructure ~~to~~ that can support Air Force or joint air operations. The TACS includes the personnel, procedures, and equipment necessary to plan, direct, and control air operations and to coordinate air operations with other components. It is composed of control agencies, sensors, and communications facilities to provide centralized

control and decentralized execution of operations. ~~The focal point for tasking and exercising OPCON is the aerospace operations center, the senior element of the TACS. The senior element of the TACS is the aerospace operations center, which is the focal point for tasking and exercising C2 activities.~~ Subordinate elements of the TACS include Airborne ~~and~~ Warning and Control System (AWACS), control and reporting center (CRC), ~~a~~ Air ~~s~~Support ~~e~~Operations ~~e~~Center (ASOC), ~~t~~ Tactical ~~a~~ Air ~~e~~Control ~~p~~Party (TACP), ~~a~~ Airborne ~~b~~ Battlefield ~~e~~Command and ~~e~~Control ~~e~~Center (ABCCC), and ~~j~~ Joint ~~s~~Surveillance, ~~t~~ Target ~~a~~ Attack ~~r~~ Radar ~~s~~System (JSTARS).

- **Army Joint Fire Support C2 Agencies.** Fire support elements (FSEs) are established from battalion to corps level. The FSE is the agency responsible for planning, execution and coordination of joint fires and fire support within the unit's area of operations (AO). These elements can support OCA operations by advising the Army unit commander on

capabilities and on the effective use of fire support assets and by assisting in the planning and coordination of attacks of OCA targets within the surface AO.

**•• Deep Operations Coordination Cell (DOCC).** The DOCC is an Army organization frequently used at division, corps, and army levels that serves as the center for focusing and integrating the planning, coordination, synchronization, and execution functions for Army deep operations. Working with the battlefield coordination detachment (BCD) and other coordination elements, the DOCC plans and coordinates, as appropriate, the use of fires, combined arms maneuver, SOF, and Army airspace ~~command and control~~ C2 in support of deep operations inside the AO, which may include OCA attack operations. ~~For operations outside the AO, the~~ The DOCC must coordinate operations outside the AO to avoid adverse effects and fratricide. If Army deep ~~maneuver~~ operations have an adverse effects ~~with~~ on other ongoing missions, the issue must be resolved through the appropriate component commander.

**•• Battlefield Coordination Detachment.** The Army provides a BCD as the interface for selected battlefield functions between the Army forces (ARFOR) and the JFACC. A BCD is collocated with the JAOC. The BCD supports OCA operations by advising the JFACC/JAOC on the capabilities and effective employment of Army systems. The BCD passes JFACC requests for ARFOR support for OCA. The BCD assists in the synchronization of joint air operations (including course of action [COA])

with Army maneuver and fires and the exchange of operational and intelligence data.

- **Army Air and Missile Defense Command (AAMDC).** The AAMDC plans, analyzes, tracks and develops air and TM targets that are nominated for attack through its attack operations cell

*For more information on Army fire support C2 agencies, see JP 3-09, Doctrine for Joint Fire Support.*

- **Navy Tactical Air Control System (NTACS).** NTACS is the principal air control system afloat. The senior Navy air control agency is the Navy tactical air control center (TACC) and the subordinate airborne element is the E-2 Hawkeye aircraft. The Navy TACC is responsible for planning and conducting naval air operations as well as coordinating operations that affect airspace. If the JFACC's command operations center is afloat, the Navy TACC may support operations for the JAOC. The link between the JFACC and naval commanders is the Naval and Amphibious Liaison Element (NALE) located in the JAOC. ~~The~~ NALE assists in integrating naval air capabilities to help the JFACC meet JFC objectives through the NTACS.

~~The NTACS is described in greater detail in JP 3-09.3, Joint Tactics, Techniques, and Procedures for Close Air Support.~~

- **The Marine Air Command and Control System (MACCS).** The MACCS provides the Marine aviation combat element (ACE) commander with the capability to C2 and influence the application of

## Chapter II

Marine aviation assets. The Marine air command and control agencies involved in OCA are the Tactical Air Command Center and the Tactical Air Operations Center (TAOC).

•• The Tactical Air Command Center is the senior agency for the ACE commander and battlestaff to plan, command, supervise, and direct Marine air-ground task force (MAGTF) air operations. The Tactical Air Command Center maintains complete information on the friendly situation, including status of air and ground forces, the air situation, and an integrated air picture with ground combat information essential to the air effort. It can provide automated displays, air tasking order (ATO) generation equipment, and data link feeds. Typically, the Marine Tactical Air Command Center is employed with the lead element of a Marine expeditionary force. Functionally, it is divided into two mutually supporting sections: the current operations section, and the future operations section. The current operations section which executes the current day's ATO and supervises the current air situation, and the future operations section, which does directed detailed planning and recommends allocation of aviation resources. The future operations section creates the Marine portion of the ATO. Functionally, it is divided into four mutually supporting sections: current operations, future operations, future plans, and air combat intelligence. The current operations section executes and assesses the daily ATO, while the future operations section helps develop future ATOs and operation orders for the ACE. The future plans

section conducts aviation planning in support of the next mission, or potential mission, assigned to the MAGTF. The air combat intelligence section supports the entire tactical air command center by producing and disseminating aviation-specific, all-source intelligence required to plan and execute air operations.

•• The TAOC is responsible for real time surveillance of assigned airspace, airspace control and management control of the intercept of hostile aircraft and missiles, and provides positive control and navigational assistance to friendly aircraft. It can be used to enhance the ability of the Tactical Air Command Center in support of deep operations. Its closest joint counterpart is the Air Force's CRC. The TAOC is the principle air defense agency in the MAGTF. Subordinate to the tactical air command center, the TAOC provides real time surveillance, direction, positive control, and navigational assistance for friendly aircraft. It performs real time direction and control of all antiair warfare operations, including manned interceptors and surface-to-surface weapons.

- The Marine Corps normally provides a Marine liaison officer to the JAOC to serve as the Service conduit within the JAOC.

d. SOF can play a significant role in OCA operations. The joint force special operations component commander (JFSOCC) and the JFACC are both supported commanders for JOA-wide operations may share common operational areas. Therefore, SOF aviation and surface activities must be closely coordinated with all joint OCA operations,

from planning through execution, to provide integration, and deconfliction, and to prevent fratricide. Integration is crucial since JFACC air assets and SOF routinely operate deep in adversary territory. The special operations liaison element (SOLE) serves as the JFSOCC's representative to the JFACC. The SOLE coordinates, deconflicts and integrates all SOF air and surface activity into the JFACC's ATO and the ACA's airspace control order (ACO).

### ~~3. Command and Control Decisions~~

~~Success of OCA operations depends on timely, often real time C2 decisions. C2 should be considered as not just organizations/systems, but the application of command (i.e., commander's intent, objectives, desired effects, etc.) with control (i.e., rules of engagement (ROE), unity of effort, planning, executing, etc.), and normally under the tenet of centralized control and decentralized execution. The joint task force C2 structure must facilitate C2 of OCA operations as required by the JFACC and the JFC. C2 for OCA may not be the same as for other joint force missions, so OCA planners must consider any differences in the timeliness and capabilities of the C2 systems of all components, down to the tactical level. Assets under the C2 of the JFACC should be able to rapidly react to changes required in OCA operations. One reason is to execute joint fires against time sensitive targets (TSTs) that have been identified, prioritized, and approved by the JFC for action. This requires real time or near real time C2. For example, through real time C2 decisions, preplanned air assets may be diverted from their primary mission to an emerging higher priority target (e.g., a mobile theater ballistic missile launcher), or ground or airborne~~

~~alert aircraft, as tasked through the ATO, may be launched against a TST. Even with the planned connectivity, unless the procedures are established and well rehearsed, execution of real time C2 decisions can be delayed or mishandled.~~

### 3. Multinational Considerations

a. Most joint operations are conducted within the context of an alliance (the result of formal agreements; i.e., treaties-) or a coalition (an ad hoc arrangement between two or more nations for common action). The international situation, along with the perspectives, motives, goals and values of each ally or coalition member vary, making each multinational operation unique. Figure II-1 identifies a number of factors that affect the military capabilities of nations.

b. These factors necessitate that the JFC (in multinational operations the JFC is titled the multinational force commander) evaluate key considerations and differences involved in planning, and executing operations in a multinational environment. The JFC must consider their coalition-partners' national interests and objectives and be prepared to negotiate with allies and coalition partners when planning and developing rules of engagement (ROE), airspace control measures, weapon control measures, and other appropriate areas. In a coalition, not all participants can be tasked for all missions. Some partners may be restricted to the types of targets they are permitted to attack and the level of risk they are willing to accept due to domestic politics or arms limitation agreements. All critical forces and geopolitical areas should receive adequate protection from air and missile threats. Sharing intelligence and warning information is an important consideration from both the security and ~~also vital to~~

**Figure II-1. Factors Affecting the Military Capabilities of Nations**

1 | ~~ensuring~~ unity of effort perspectives. The  
2 | senior US officer needs to become  
3 | personally concerned with the issues of  
4 | intelligence sharing and releasing of  
5 | information early in the process in order to  
6 | ensure the commander's requirements  
7 | have been clearly stated and understood.

8 |  
9 | c. When planning and executing OCA  
10 | operations, the combined joint force air  
11 | component commander (CJFACC) must  
12 | consider force capabilities and disparities,  
13 | information and equipment security levels,  
14 | and procedural and organizational  
15 | differences. Language barriers may  
16 | influence the ability of coalition air forces  
17 | to achieve unity of effort. Before  
18 | assigning tasks to elements of force, the  
19 |

20 | CJFACC should ensure that all elements  
21 | can make meaningful contributions to the  
22 | overall counterair mission. Agreement on  
23 | objectives, threats, and a clearly defined,  
24 | responsive and interoperable C2 structure  
25 | are crucial to effective OCA operations.  
26 | The CJFACC should consider using

# CHAPTER III

## PLANNING OFFENSIVE COUNTERAIR OPERATIONS PLANNING

“Know your enemy and know yourself, in a hundred battles you will be successful.”

Sun Tzu

### 1. Introduction

The JFACC is responsible for the planning and execution of OCA operations. There are three important aspects of the planning process: setting clearly defined objectives, determining effects that support the objectives, and unity of effort. Proper planning for OCA operations relies on accurate joint intelligence preparation of the battlespace (JIPB). OCA planning is part of an overall joint air operations plan, discussed further in this chapter. Other considerations for OCA planning are ~~adversary's~~ adversary air defense systems, airspace control, ROE, and identification requirements.

### 2. Joint Intelligence Preparation of the Battlespace

a. Knowledge of the adversary is one of the fundamentals of joint warfare. JIPB is a continuous process, which enables the JFC and his staff to visualize the full spectrum of adversary capabilities and potential COAs across all dimensions of the battlespace. JIPB provides the basis for intelligence direction and synchronization that supports the COA selected by the JFC.

*Details on the JIPB process can be found in JP 2-01.3, JTTP for Joint Intelligence Preparation of the Battlespace.*

b. For offensive counterair, this would relate to any information about ~~the~~ adversary's air and missile threats and

supporting infrastructure. It ~~also~~ also would include information on adversary integrated air defense, C2 networks, ~~and~~ adversary radar coverage, and other early warning/detection systems. Specifically for OCA, the intelligence preparation of the battlespace (IPB) will provide available information on:

- Aircraft operating bases and dispersal sites to include aircraft carriers and other air capable ships.
- TMs and their operating locations; target sets, to include launch platforms and infrastructure: C2 nodes, missile stocks, forward operating locations/bases, trans-load sites, and logistics.
- Signal operating instructions, vulnerabilities, redundancies, capabilities, locations, and order of battle of ~~the~~ adversary's integrated air defense systems (IADSs), communication links, and C4I systems and facilities.
- ~~Surface-to-air missiles~~ (SAMs), antiaircraft artillery (AAA), and ~~EW~~ early warning/ground control intercept (GCI) sites and facilities.
- Signals intelligence and EW assets.
- Climate and terrain within the JOA and their effects on friendly and adversary operations.

## Chapter III

• Strengths and vulnerabilities of adversary offensive and defensive air systems.

• Changes of ~~the~~ adversary's indirect and direct threat emitters, including wartime reserve modes and reprogramming of target sensing weapon systems.

• Location, status, ~~of all key nodes and targets that affect the adversary's ability to sustain air operations and disposition of weapons of mass destruction—storage—facilities~~ capability.

• Location and status of all key nodes and targets that affect the ability to sustain air operations.

### 3. ~~Offensive Counterair~~CA and the Joint Air Operations Plan

a. OCA planning is an integral part of overall joint air operations planning. Normally, there are five stages in the joint air operations planning process as shown in Figure III-1, and each stage produces a desired product. The steps are not required to be completed in the given order, and various phases may be concurrent or sequential. The stages must be integrated and the products of each phase must be checked and verified for consistency.

• ~~Operational~~ **Environment Research.** The product of this phase is primarily the IPB that presents an in-depth knowledge of the operational environment. This phase is focused on gaining information about friendly and adversary capabilities and intentions, doctrine, and the environment in which the operations will take place. Key

~~factors such as threats and airbase availability will affect the strategy development process. A large adversary air threat will require more time and dedicated assets to achieve air superiority, to the initial detriment of other missions.~~

• ~~Objective Determination.~~ The products of this phase are clearly defined, quantified objectives that will contribute towards the accomplishment of the JFC's overall objectives. The source of planning objectives is usually documented in the JFC's initial planning guidance and the operation or campaign plan. Joint air objectives are derived from the JFC's objectives, and OCA objectives are derived from the JFACC's joint air operations plan (JAOP). The objective of OCA operations is to seize the initiative and gain and maintain air superiority over the adversary's territory. This involves two tasks. The first is to render the adversary's offensive air and missile capability combat ineffective. The second is to render the adversary's defensive air and missile capability combat ineffective.

• ~~Strategy Identification.~~ The JFC, in coordination with his component commanders, selects a strategy best suited to attain his objectives within identified constraints by taking advantage of adversary COGs. The selected strategy also ensures that friendly COGs are protected. The JFACC then develops a plan that supports the JFC's strategy. Strategic focus is typically one of coercion, denial, or decapitation. A strategy of coercion intends to convince the adversary that the losses associated with his COA are not worth the gains that he desires. A strategy of denial

1 seeks to make the adversary  
2 incapable of pursuing his chosen  
3 COA. A strategy of decapitation is  
4 focused on breaking critical C2  
5 linkages and isolating key leadership.  
6 The product of this phase is a clearly  
7 defined joint air operations strategy  
8 statement.

9  
10 • **Centers of Gravity (COG)**  
11 **Identification.** The product of this  
12 phase is to identify the strategic,  
13 operational, and tactical COGs that  
14 will achieve JFACC and JFC  
15 objectives. A COG describes the  
16 central features of an adversary  
17 system or force's power that, if  
18 defeated, may have the most decisive  
19 result. It is important to remember  
20 that COGs are dynamic agents of  
21 action or influence; they make things  
22 happen. A useful way of analyzing  
23 COGs is using a construct of COG—  
24 Critical Capabilities—Critical  
25 Requirements—Critical  
26 Vulnerabilities. Critical Capabilities  
27 are primary abilities that merits a  
28 COG to be identified as such for a  
29 given scenario, situation, or mission.  
30 From the adversary's point of view,  
31 examples of these critical capabilities  
32 include the ability to: survive attacks;  
33 receive critical intelligence and  
34 information, and communicate with  
35 higher commanders and subordinate  
36 units. From the JFACC's point of  
37 view, critical capabilities include the  
38 abilities to: project power long  
39 distances, locate enemy units/forces,  
40 parry and surprise enemy attacks,  
41 destroy enemy units/forces, and  
42 maintain strength. Critical  
43 requirements are defined as essential  
44 conditions, resources and means for a  
45 critical capability to be fully  
46 operative. Examples include, C2  
47 systems, transportation nodes, lines of  
48 communications, fighter aircraft,  
49 SAM systems, etc. Finally, critical

50 vulnerabilities are critical  
51 requirements, or components, that are  
52 deficient, or vulnerable to  
53 neutralization, interdiction, or attack  
54 (moral/physical harm) in a manner  
55 achieving decisive results—the  
56 smaller the resources and effort  
57 applied and the smaller the risk and  
58 cost, the better. This effort should  
59 include both operators and  
60 intelligence personnel. After enemy  
61 critical vulnerabilities are identified,  
62 they should be prioritized. This  
63 priority is based on the critical  
64 vulnerability's impact on achieving  
65 the objective, in the shortest possible  
66 time and with the fewest resources.  
67 The prioritized list of critical  
68 vulnerabilities is sent into the Joint  
69 Targeting Process after JFACC  
70 approval. The joint force typically  
71 has the ability to attack COGs  
72 throughout the area of responsibility  
73 (AOR)/JOA. Proper analysis of what  
74 constitutes a COG, and how best to  
75 attack it, forms the heart of this phase  
76 in JAOP planning. For example, the  
77 adversary IADS may need to be  
78 defeated before air operations can be  
79 conducted against COGs. This was  
80 the case during DESERT STORM.

81  
82 • **JAOP Development.** Once  
83 strategic objectives are established,  
84 this phase develops the strategy by  
85 identifying the critical nodes that  
86 support or adversary COGs. Next,  
87 targets are selected that are  
88 vulnerable to attack and that will best  
89 affect the critical nodes in order to  
90 gain the associated operational  
91 objectives. Lastly, the most  
92 appropriate weapon systems are  
93 selected for employment to gain the  
94 desired effects within operational and  
95 tactical constraints. The result of this  
96 phase is the final JAOP that details  
97 how joint air operations employment  
98 will support the JFC's operation or

### Chapter III

campaign plan. The JAOP should identify objectives and target sets (to include TSTs) by priority order, describing in what order they should be attacked or dealt with, the desired results, and the weight of effort required to achieve the desired results in support of the JFC's objectives. OCA operations are conducted to gain and maintain air superiority or air supremacy throughout the JOA, or are localized in time and place to support emerging or limited joint operations. Establishing the appropriate degree of air superiority is the necessary prerequisite for the effective use of military power. For OCA operations it should account for current and potential adversary offensive and defensive threats and indicate the phasing of joint air operations in relation to the JFC's operation or campaign plan. The results of the planning process are incorporated into the daily Master Air Attack Plan (MAAP) (see Figure III-2 for sample MAAP). The MAAP forms the basis of the daily ATO. During MAAP development OCA resources are allocated to accomplish specific targets. OCA planning considers the operational context and environment, and the results from current operations. Planners will work with specialty teams; component liaisons; and unit representatives; the Aerospace Operations Directive, Joint Integrated Prioritized Target List, threat situation, joint prioritized collection, forecast weather, weapons system availability, air refueling, and weapons employment options are synchronized. The MAAP has sufficient flexibility to adapt to the

changing situation throughout the theater. Planners adjust to the changing availability of joint assets to ensure each task or target is assigned the best available capability.

a. Normally, there are six phases to the air estimate process that results in the joint air operations plan. OCA planning is an integral part of this overall joint air operations planning.

While the phases are presented in sequential order, work on them can be either concurrent or sequential. Nevertheless, the phases are integrated and the products of each phase are checked and verified for coherence. Figure III-1 illustrates the six phases.

For detailed description of the joint air estimate process, see JP 3-30, Command and Control for Joint Air Operations.

The main effort of mission analysis is in analyzing the JFC guidance, the situation, resources and risks involved. Mission analysis provides the data that is used to answer the "who, what, when, where and why" of an operation. The JFACC uses the mission analysis to produce air objectives that support the JFC's campaign. In general terms, the focus of OCA is to attain and maintain air superiority over adversary territory. This requires that both an adversary's offensive and defensive air and missile capability be made combat ineffective. Specific OCA objectives must be clearly defined to reduce the risk of mission failure. They must also be measurable so that the JFACC can know when OCA operations have achieved the intended effect(s).

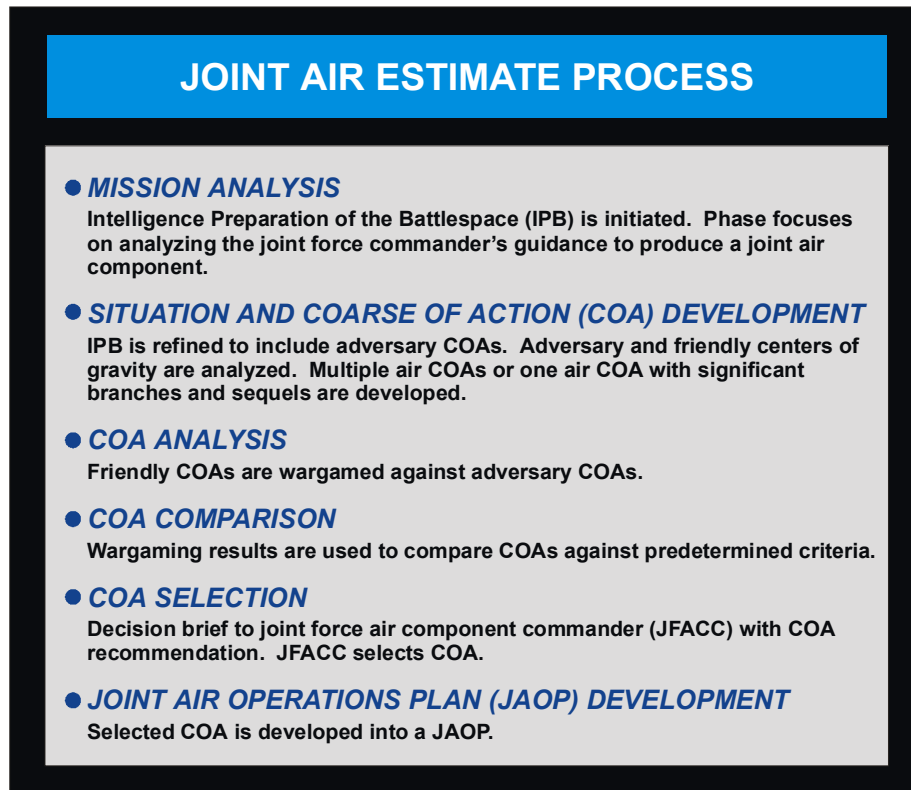

Figure III-1. Joint Air Estimate Process

1 After establishing OCA objectives, the 22 and potential adversary offensive and  
2 JFACC uses the data from the mission 23 defensive threats and indicate the phasing  
3 analysis to examine resources and risks, as 24 of joint air operations. The results of the  
4 well as adversary COA (both known and 25 planning process are incorporated into the  
5 anticipated) to arrive at the best possible 26 daily Master Air Attack Plan (MAAP)  
6 scheme for integrating OCA into the 27 (see Figure III-2 for sample MAAP).  
7 JFACC's COA for joint air operations. 28  
8  
9 The JFACC's COA is approved or 29 The MAAP forms the basis of the daily  
10 amended by the JFC and gets translated 30 ATO. During MAAP development OCA  
11 into a final JAOP that includes details on 31 resources are allocated to accomplish  
12 how OCA is integrated into the overall air 32 specific tasks. OCA planning considers  
13 operations that will support the JFC's 33 the operational context and environment,  
14 operation or campaign plan. The JAOP 34 and the results from current operations.  
15 should identify objectives by priority 35 Planners will work with specialty teams,  
16 order, describing in what order they 36 component liaisons, and unit  
17 should be attacked or dealt with, the 37 representatives; the Aerospace Operations  
18 desired effects, and the weight of effort 38 Directive, Joint Integrated Prioritized  
19 required to achieve the desired results in 39 Target List, threat situation, joint  
20 support of the JFC's objectives. For OCA 40 prioritized collection, forecast weather,  
21 operations it should account for current 41 weapons system availability, air refueling,  
42

Commanders must identify the ~~strategic, operational, and tactical~~ centers of gravity that will achieve JFACC and JFC objectives.

#### IRAQI INTEGRATED AIR DEFENSE SYSTEM DURING DESERT STORM

“The underlying principle of the SEAD plan was to attack KARI [nickname for Iraqi integrated air defense system] as a whole. It would not be necessary to kill all the SAM sites; it would be enough, if the coalition SEAD assets intimidated the Iraqis to the point that those running SAM sites would refrain from turning radar on. Finally, the plan to suppress enemy air defenses aimed to defeat the SAM threat, so that allied aircraft could operate at medium altitudes which would minimize the threat posed by Iraqi AAA. In effect, planners looked to maximize the inherent inefficiencies and frictions within KARI. They believed that the Iraqis could not operate effectively without centralized direction; once the system began to break down at the center, it would no longer function at all.”

SOURCE: *The Gulf War Air Power Survey (GWAPS)*, Volume II

and weapons employment options are synchronized. The MAAP has sufficient flexibility to adapt to the changing situation throughout the theater. Planners adjust to the changing availability of joint assets to ensure each task or target is assigned the best available capability.

#### b. OCA Missions and Resources

• **Attack Operations.** All Service and functional components normally have forces capable of supporting attack operations. Fixed-wing aircraft provide a long range, high payload capacity; ~~and~~

with the ability to deliver precision weapons outside of many threat envelopes. Manned aircraft are flexible; if conditions do not permit attack of the primary target, they can be diverted to attack secondary targets. ~~Surface-to-surface missile-SSM~~ systems provide destruction capability particularly useful in high-risk areas. Sea or air launched cruise missiles can attack targets in high-risk areas without risking flight personnel. ~~SOF forces~~ have the capability to conduct operations that include direct action, ~~provide~~ providing terminal guidance, ~~observe~~ observing attacks, and collecting intelligence. Artillery and naval surface

1 fire can attack OCA targets in range. In a  
2 surface AO, surface-to-surface fires may  
3 provide the safest and fastest method of  
4 attack. While not their primary mission,  
5 attack helicopters may be used to attack  
6 certain OCA targets.

7  
8 ~~• **Fighter Sweep and Escort.** Any~~  
9 ~~fighter aircraft with air-to-air~~  
10 ~~ordnance and fire control radar can~~  
11 ~~conduct fighter sweep and escort~~  
12 ~~missions against enemy fighter~~  
13 ~~aircraft. Aircraft with beyond visual~~  
14 ~~range identification (ID) systems and~~  
15 ~~radar optimized against air-to-air~~  
16 ~~threats are desired for the sweep and~~  
17 ~~escort role. Fighter sweep and escort~~  
18 ~~missions are more effective when~~  
19 ~~supported by early warning radar~~  
20 ~~assets. Escorts against SAMs require~~  
21 ~~specialized equipment designed to~~  
22 ~~detect, identify, and suppress enemy~~  
23 ~~air defense radar.~~

24  
25 • **Fighter Escort.** Normally, air-to-air  
26 capable fighter aircraft are used as  
27 escorts to protect high value airborne  
28 assets (i.e., AWACS, RIVET JOINT,  
29 JSTARS, etc.), fighter-bombers,  
30 bombers, airlift, tanker, and other  
31 friendly aircraft from attacks by  
32 adversary aircraft. When surface air  
33 defense threats are a concern,

34 especially equipped and trained air  
35 defense suppression assets can be  
36 used in a supporting escort role (see  
37 Localized Suppression in Chapter IV,  
38 “Offensive Counterair Execution”).  
39 The capabilities of fighter escorts  
40 (i.e., speed, sophistication of  
41 weaponry, data links, guns, etc.) are  
42 determined by the operational/tactical  
43 commanders responsible for air  
44 operations after considering the  
45 mission requirements.

46  
47 • **Fighter Sweep.** These offensive  
48 missions by fighters/fighter-bombers  
49 are designed to seek out and destroy  
50 adversary aircraft in an allotted area  
51 of operations. Normally, fighter  
52 sweeps are conducted in areas where  
53 the commander has attained or nearly  
54 attained air superiority, otherwise  
55 attack operations and SEAD missions  
56 are better suited because of the  
57 adversary threat. One of the  
58 objectives is further destruction of all  
59 adversary air and missile assets.  
60 Airborne warning and control, and  
61 airborne targeting assets (i.e.,  
62 AWACS, JSTARS, etc.) should be  
63 used to support fighter sweeps.  
64  
65

8 ~~fires (including mortars, artillery,~~ 17 ~~destructive means may place large~~  
9 ~~missiles, or naval surface fire); and~~ 18 ~~demands on the available combat~~

capabilities/forces. Examples include air-to-ground munitions, air-to-surface and surface-to-surface missiles, air scatterable mines, and artillery. Disruptive means temporarily deny, degrade, deceive, delay, or neutralize enemy IADS. Active disruptive means include electronic attack, ARMs, directed energy, electromagnetic jamming, electromagnetic deception, expendables (chaff, flares, and decoys) and tactics such as deception, avoidance, or evasive flight profiles. Passive disruptive means include emission control, camouflage, infrared shielding, warning receivers, and material design features. The SEAD mission is used to disrupt or destroy adversary surface air defense systems that threaten friendly air operations. Specially trained aircrew and specially equipped aircraft are designed for SEAD missions, especially against an IADS. SEAD dedicated aircraft are normally equipped with special electronic detection and countermeasures equipment, deceptive expendables (chaff, flares, or decoys), and anti-radiation missiles (ARMs) for use against emitting radars. Specialized SEAD assets should not be used for other missions without a SEAD requirement. Other fighter and fighter-bomber aircraft can be armed to support the SEAD mission, especially against the adversary air defense infrastructure. SEAD assets are also used in conjunction with other air operations/missions (i.e., air interdiction, OCA attack, etc.) when adversary surface air defenses are a factor. Traditionally, there are three categories of SEAD: area of responsibility (AOR)/JOA- wide joint SEAD, localized SEAD, and opportune suppression.

See Chapter IV, "Offensive Counterair Execution," for more detailed discussions.

#### • **Air Tasking Order Development.**

After the JFACC approves the MAAP, detailed preparations continue on the ATO. There are normally multiple ATOs in various stages of development up to execution. Components may submit critical changes to target requests and asset availability. If the affected ATO has been published, such changes will likely end up as amendments to the ATO. The ACA and AADC instructions provide sufficient detail to execute all missions tasked in the ATO. These directions enable combat operations without undue restrictions, balancing combat effectiveness with the safe, orderly, and expeditious use of airspace.

#### **4. Adversary Integrated Air Defense Systems**

a. Adversary IADS include detection, C2, and weapons integrated into a system. They are assigned to protect those assets critical to achieving the adversary's strategic, operational, and tactical objectives. IADS attempt to destroy, disrupt, or neutralize friendly attack air and missile systems. Defensive tactics may include jamming aircraft navigation, communication, and/or target acquisition systems to degrade effectiveness. IADS have become increasingly complex and can differ widely in terms of organization, sophistication, and operational procedures. The IADS need to be analyzed in depth to avoid its strengths and exploit its weaknesses.

#### b. **IADS-Command and Control C2.**

Traditionally, adversaries have exercised

### Chapter III

1 rigid control over air defense activities.  
2 Air defense commanders located in  
3 centralized C2 posts provide warning and  
4 cueing, assign targets, and control  
5 weapons readiness using overlapping and  
6 redundant communication links.  
7 However, potential adversaries may  
8 employ a decentralized system, where  
9 multiple nodes may have the capability to  
10 direct the entire IADS. ~~IADS frequently~~  
11 ~~combine radar and C2 systems from many~~  
12 ~~countries.~~ Radio-based C2 is now being  
13 supplemented by communications over  
14 landline (cable), microwave, cellular, and  
15 internet systems.

16  
17 c. **IADS Employment.** Mobile ~~IADS~~  
18 ~~air defense~~ elements may stress  
19 echelonning of forces in depth and include  
20 tactical and strategic SAM and AAA  
21 systems. ~~Passive~~ Technologies are now  
22 available that ~~allow passive detection and~~  
23 give little warning prior to engagement by  
24 ~~IADS-air defense~~ forces. Adversaries  
25 have become adept at camouflage,  
26 concealment, and deception, complicating  
27 targeting. SAM forces have become ~~more~~  
28 mobile, with some systems demonstrating  
29 a “shoot-to-move” time in minutes rather  
30 than hours or days. Modern SAM  
31 systems have been dramatically improved  
32 in both range and capability and some  
33 older systems have received substantial  
34 upgrades that continue to make them  
35 serious threats to US forces. Long-range  
36 SAMs are usually located near high-value  
37 targets and provide barrier, area, and point  
38 defense coverage. However, their range  
39 and mobility mean these systems could  
40 provide air defense coverage over the  
41 forward edge of the battlefield at various  
42 stages of the conflict and threaten friendly  
43 airborne platforms well into friendly  
44 airspace. ~~Short-range air defense~~  
45 ~~(SHORAD) includes Man-portable-man-~~  
46 ~~portable~~ air defenses ~~systems~~  
47 (MANPADSs) ~~include short-ranged~~  
48 ~~SAMs~~ that may be guided by ~~infrared~~

49 infra-red (~~IR~~) or radio frequency methods,  
50 ~~and by AAA. MANPADs SHORAD~~ will  
51 probably present ~~the a~~ primary threat for  
52 air assault, ~~airlift, air mobility,~~ and CAS  
53 operations. Their proliferation and lack of  
54 warning make them a serious threat to all  
55 fixed- and rotary-wing aircraft operating  
56 at low and medium altitudes, ~~and~~  
57 especially during takeoff and landing.  
58 OCA planners should expect MANPADS  
59 and AAA coverage wherever adversary  
60 forces are encountered.

### 5. Airspace Control

61  
62  
63 a. Airspace control includes  
64 coordinating, integrating, and regulating  
65 airspace to increase operational  
66 effectiveness. Subject to the authority and  
67 approval of the JFC, the ACA develops  
68 broad policies and procedures for airspace  
69 control and for the coordination required  
70 among units within the AOR/JOA. The  
71 ACA establishes an airspace control  
72 system that is responsive to the needs of  
73 the JFC, provides for integration of the  
74 airspace control system with that of the  
75 host nation, and coordinates and  
76 deconflicts user requirements. The ACA  
77 develops the airspace control plan (ACP)  
78 and, after JFC approval, promulgates it  
79 throughout the AOR/JOA.  
80 Implementation of the ACP is through the  
81 ACO, which must be complied with by all  
82 components.

83  
84 b. The purpose of the ACP is to  
85 accommodate and expedite the flow of air  
86 traffic in the AOR/JOA. The ACP is  
87 discussed in greater detail in JP 3-52,  
88 *Doctrine for Joint Airspace Control in the*  
89 *Combat Zone*. The objective is to  
90 maximize effectiveness of combat  
91 operations without adding undue  
92 restrictions and with minimal adverse  
93 impact on the capabilities of any Service  
94 or functional component. Airspace  
95 control functions must be closely  
96 coordinated with other operations

1 throughout the JOA. Because ~~the~~ airspace  
2 control areas normally coincide with air  
3 defense boundaries and there are many  
4 ~~more~~ issues relating to airspace control the  
5 for DCA mission, operations, the ACP  
6 must still ~~be developed to~~ allow the  
7 effective and efficient conduct of the OCA  
8 mission. Airspace control must be  
9 flexible enough to meet rapid changes in  
10 some ~~OCA~~ air operations, such as the  
11 prosecution of time-sensitive targets  
12 (TSTs). Airspace control should be  
13 executed through a real-time-responsive  
14 theater/tactical air control system.  
15 Specially equipped airborne warning and  
16 control assets are often used for real time  
17 airspace control. Specific OCA  
18 requirements that must be accounted for in  
19 the ACP include:

- 21 • Orbit locations for airborne warning  
22 and C2, surveillance, reconnaissance,  
23 air refueling, and EW platforms  
24 supporting the OCA effort.
- 26 • Procedures to expeditiously route  
27 outbound OCA packages through  
28 friendly ~~IADS~~ airspace. This issue  
29 can become more complex in a  
30 coalition or multinational  
31 environment.
- 33 • Procedures to ~~C2~~ control OCA  
34 missions during attack operations,  
35 fighter sweeps, and escort missions.  
36 These missions will often be beyond  
37 the line of sight of ground based C2  
38 agencies and may require airborne C2  
39 or relay platforms.
- 41 • ~~Return to force procedures for OCA~~  
42 ~~packages (i.e., m~~ Minimum risk  
43 routes). Identification, friend or foe  
44 (IFF) turn off/on  
45 procedures/locations. Sanitizing  
46 returning OCA packages.

- 48 • Procedures to rapidly deconflict  
49 airspace to allow attack of TSTs by  
50 long range surface fires such as Army  
51 Tactical Missile System, land attack  
52 surface missile, SSMs or cruise  
53 missiles.

55 c. ~~The~~ Real time airspace control is  
56 ~~normally~~ executed through tactical  
57 airspace via elements of the theater air  
58 control units system. The sensor  
59 capability of airborne platforms makes  
60 them well suited for providing airspace  
61 control for real time execution of OCA  
62 operations.

## 64 6. Rules of Engagement

66 ROE are directives issued by a  
67 competent military authority which  
68 delineate the circumstances and  
69 limitations under which United States  
70 forces will initiate and/or continue combat  
71 engagement with other forces  
72 encountered. Baseline ROE are found in  
73 CJCS Chairman of the Joint Chiefs of  
74 Staff Instruction (CJCSI) 3121.01A,  
75 Standing Rules of Engagement for US  
76 Forces.

78 The Joint Chiefs of Staff (JCS) Standing  
79 Rules of Engagement (SROE) provide  
80 implementation guidance on the  
81 application of force for mission  
82 accomplishment and the exercise of the  
83 inherent right and obligation of self-  
84 defense. See CJCSI 3121.01A, Standing  
85 Rules of Engagement for US Forces. The  
86 SROE establish fundamental policies and  
87 procedures governing the actions to be  
88 taken by US force commanders in the  
89 event of military attack against the United  
90 States and during all military operations,  
91 contingencies, terrorist attacks, or  
92 prolonged conflicts outside the territorial  
93 jurisdiction of the United States.

94 Combatant commanders may augment  
95 the JCS SROE with theater-specific ROE

## Chapter III

and with supplemental instructions. However, nothing in the SROE or in the combatant commander promulgated ROE may limit a commander's inherent authority and obligation to use all necessary means available and to take all appropriate actions in self-defense of the unit and other US forces in the vicinity.

The JFC implements the JCS SROE and, acting through the combatant commander's delegated authority, develops the JOA-specific ROE. The JFC is responsible for establishing and implementing the ROE. The JFC normally requests inputs from subordinate commanders when developing the ROE. To prevent ROE violations or misunderstandings, they should be simple, easily understandable rules with little room for interpretation. When planning OCA operations, the component commanders must ensure they comply with the established ROE for the JOA. ROE can limit or restrict certain options, targets, and methods. ROE are normally found in the Special Instructions section of the ATO.

### 7. Combat Identification

The objective of combat identification (CID) is to maximize mission effectiveness by providing high confidence IFF. Proper identification of targets is important to OCA operations in order to prevent fratricide and permit employment of weapons at optimum ranges. Some systems have an autonomous identification capability, and data links and digital information exchanges (including real time imagery of target areas) greatly enhance the ability to perform effective CID. Maximizing weapons performance conserves resources and reduces risk to friendly forces. CID information may be obtained from onboard or off board surface, air, and

space systems. An effective C2 system is required to gather, assimilate, assess and distribute this information from myriad sources. Thorough knowledge of the scheme of maneuver, operations plans and airspace control measures documented in the ACP, ACO, and area air defense plan are also essential to the process. To avoid a single point of failure, no one node acts as an exclusive conduit of all CID information. Electronic methods, ~~which~~ provide the most rapid and reliable means of identification, ~~and~~ are normally used when available. Visual and procedural means of identification are not as practical but may be essential in some scenarios. Airspace control requires an effective combination of positive and procedural CID. Positive identification relies on a high confidence CID derived from visual observation, radar observation of point of origin, and/or electronic means by an authorized control facility. Procedural identification relies on a combination of airspace control measures documented in the ACP or ACO. For most scenarios, a combination of positive and procedural techniques is used to identify friendlies, neutrals, and foes. For SEAD operations correct identification of electromagnetic signals is important to prevent electromagnetic interference between friendly systems.

### 8. Enabling Offensive Counterair ~~CA~~ Operations

a. Air-Mobility Refueling. The use of air mobility resources is one example of enabling operations contributing to the overall success of OCA operations. Air refueling assets can greatly increase the range and endurance of aircraft conducting OCA missions deep into adversary territory. During Operation DESERT STORM, air refueling operations extended the range of F-117s

*Air refueling assets can greatly increase the range and endurance of aircraft conducting OCA missions deep into adversary territory.*

1 enabling them to strike vital Iraqi air  
2 defense C2 nodes deep in Iraq.

3  
4 **b. Space Operations.** ~~Due to the~~ The  
5 enabling capabilities that military space  
6 operations bring to the joint force, ~~these~~  
7 ~~operations and capabilities~~ should be  
8 considered when planning OCA  
9 operations. For example, to support attack  
10 operations, space forces ~~enhancement~~ may  
11 provide initial threat detection and  
12 location, assured global and theaterwide  
13 communications, ~~C4I~~, real time weather,  
14 ~~and~~ high-resolution imagery, and signals  
15 intelligence. In addition, global  
16 positioning, navigation, and timing assets  
17 facilitate the accuracy of precision  
18 munitions and theaterwide identification  
19 (ID). ~~Under the space control mission~~  
20 ~~area, s~~Space assets also may be used to  
21 facilitate emission control and  
22 jamming/spoofing when conducting  
23 SEAD missions.

24  
25 **c. IRS Operations.** ISR operations  
26 provide situational awareness. These  
27 platforms provide the most accurate  
28 “picture” of the adversary. ISR assets are  
29 generally high demand/low density and  
30 require careful planning.

31

32 **d. Information Operations.** The joint  
33 force is most effective when they can  
34 exploit information and achieve  
35 information superiority. Effective  
36 integration of IO is essential in OCA  
37 operations and planning. Information  
38 warfare (IW) is part of IO and is  
39 conducted to achieve specific objectives  
40 over an adversary. ~~For example,~~  
41 Examples of IW include actions  
42 disrupting that disrupt vital air defense  
43 information transmissions, that degrade  
44 degrading the adversary’s capability to  
45 recognize the situation until it is too late or  
46 to take appropriate action can facilitate the  
47 successful accomplishment of situational  
48 awareness, or denying sensor capability,  
49 as in SEAD missions. Information and  
50 the accompanying technology can also  
51 provide the basis for weapons accuracy,  
52 effective C2, seamless communications,  
53 intelligence gathering and dissemination,  
54 and sensor data processing. IW can be  
55 executed against OCA targets such as C2  
56 systems, theater missiles, air defenses, and  
57 airfields/operating bases. Examples  
58 include malicious codes, EW, or  
59 electromagnetic pulse generators, which  
60 may afford access to a target inaccessible  
61 by other means. Military deception is part  
62 of offensive IO and can be used to

## Chapter III

*Information and the accompanying technology can also provide the basis for weapons accuracy.*

effectively achieve OCA objectives. Psychological operations (PSYOP) are also a subset of IW and can play a role in degrading the ~~enemy—adversary~~ air defenses. For example, a real or imagined ability by friendly forces to target specific air defense components could be magnified by a PSYOP—~~campaign~~ operation. Such a distorted image could cause individual adversary soldiers to abandon their equipment at critical times.

*For more information on information operations see JP 3-13, Joint Doctrine for Information Operations.*

e. **Special Operations (SO).** SO have become an integral part of a theater

campaign across the range of military operations and SO capabilities should be considered in OCA plans. For example, SOF ~~direct-action~~ missions may be integrated into OCA attack operations to destroy or disrupt TBM launch sites, ~~or~~ provide terminal guidance for air attacks, conduct stand off attacks, raids, etc. to ~~destroy an~~ adversary airfields, air defense sites, or ~~a~~ critical C2 nodes. When performing special reconnaissance missions, SOF can provide critical target and threat assessments and ~~post-strike~~ post-strike reconnaissance to measure the results of an attack operation or SEAD mission.

### THE FIRST COUNTERAIR MISSION OF DESERT STORM

**“At 0239, twenty-one minutes before H-hour, Army APACHE helicopters, led by three Air Force MH-53s, attacked two Iraqi early warning sites up on the frontier. This first mission opened a corridor for several packages of aircraft with early missions. A package of F-15Es, a four ship in the lead, moved through the gap to attack SCUD sites in western Iraq; two EF-111s supported that strike by jamming Iraqi radar. Another eighteen F-15Es followed to attack other fixed and mobile SCUD launchers.”**

**SOURCE: *The Gulf War Airpower Survey (GWAPS)*, Volume II, pg 120**

## CHAPTER IV OFFENSIVE COUNTERAIR EXECUTION

*"If you don't control the air, you'd better not go to war."*

General Charles Horner

### 1. General

The preferred ~~method of countering strategy to counter~~ air and missile threats is to execute OCA operations ~~to destroy or disrupt them~~ prior to the launch. These operations include OCA attack operations, fighter sweep, escort, and SEAD (Figure IV-1). ~~These operations and~~ rely on C4I systems, which support real and near real time deconfliction with other operations.

### 2. Attack Operations

OCA attack operations are offensive actions ~~against to disrupt or destroy~~ surface targets, ~~which that~~ contribute to ~~the~~ adversary's air and missile

~~capabilities. The objective of attack operations is to disrupt or destroy adversary aircraft and missile forces by attacking prior to launch. These operations attempt to prevent the launch of aircraft and missiles by attacking elements such as launch and including intelligence, surveillance, and reconnaissance (ISR) platforms, C2 nodes, ammunition stocks and infrastructure. Attack operations are executed by component-level forces capable of attacking targets with both lethal and nonlethal means to achieve the desired effects.~~ Counterair attack operations can be preemptive or reactive and sustained efforts ~~are may be~~ required to reduce or neutralize ~~an~~ adversary's air and missile capabilities, ~~because of the significant threat to friendly forces.~~ Attack operations are highly dependant on C2 systems and processes and rapid targeting capability. These systems should be thoroughly coordinated, synchronized, and integrated among joint force components. Attack operations are complex and challenging because many adversary systems may be hard to detect. Most systems will be dispersed, deployed in depth, mobile, and employ passive electronic measures. To enhance the probability of success, joint forces should plan and execute attack operations using all-source intelligence to locate ~~and attack~~ ~~an~~ adversary's air and missile systems, components and supporting infrastructure.

a. ~~Threats. The OCA threats, which are targeted in attack operations, are aircraft, theater surface to surface missiles, early warning radar, reconnaissance, surveillance and target~~

Figure IV-1. Primary Offensive Counterair Missions

## Chapter IV

~~acquisition platforms, and C4I nodes, and their supporting infrastructure. During attack operations, adversary aircraft are targeted on airfields and in aircraft shelters. Aircraft supporting infrastructure include the runways, airfields, maintenance facilities, personnel and their logistic support. TMs are weapons that possess both military threat and political intimidation characteristics. The TM target set includes launch platforms and infrastructure, C2 nodes, missile stocks, forward operating locations/bases, trans-load sites and logistics).~~ **Targets.** Attack operations target the following components of adversary air and missile capability:

- Air and missile unit C2 nodes/centers;
- Aircraft on airfields and in shelters;
- TM fixed and mobile launchers;
- Airfield runways and taxiways;
- Maintenance facilities and equipment;
- Operations and maintenance personnel;
- Logistic support (e.g., fuel storage, munitions depots, electrical power generation);
- ISR and target acquisition systems.

### b. Resources

- Systems used to support attack operations include fixed- and rotary-wing aircraft, cruise missiles, SOF, ~~can~~on and rocket propelled artillery, other surface-to-surface fires, ground maneuver forces, EW and ISR systems. Manned aircraft are flexible

and provide a pilot in the loop to make last minute decisions in the target area. Surface-to-surface weapons are responsive and many deliver lethal fires regardless of the weather conditions. Cruise missiles can attack targets at great ranges and mitigate risk to friendly forces. SOF ~~forces~~ have the capabilities to perform special reconnaissance, terminal guidance and direct action. ~~The covert or clandestine nature of SOF forces also~~ The ability of SOF to conduct clandestine and/or covert operations allows them to gather battle damage assessment information on known or suspected target areas beyond the range and capabilities of other joint forces.

- Attack operations are highly ~~dependant~~ dependent upon predictive and developed intelligence. Because of the difficulty in detecting highly mobile launch systems, a seamless network of C4I systems and sensors should be employed to share information and support near real time targeting and attack. National sensor systems will normally be required to augment theater air and surface based systems. Many national and Department of Defense space systems provide tactical information to assist in launch point determination and tracking. Additionally, intelligence products collected by these systems can enable theater forces to anticipate hostile air and missile operations and determine adversary unit locations.

c. **Execution.** The JFC may apportion additional component capabilities and/or forces to the JFACC to support theater/JOA-wide attack operations. The JFACC's recommendation and the JFC's decision on apportionment determine the

## Offensive Counterair Execution

amount of effort made available for OCA attack operations.

- ~~Preplanned~~—**Planned** Attack Operations. Normally, OCA targets are nominated and prioritized through the joint targeting process (JP 3-60, *Joint Doctrine for Targeting*, Chapter II describes the joint targeting process in greater detail). The JFC may have a list of approved TSTs that must be attacked at the on-set of hostilities. Typically, JFCs organize a joint targeting coordination board (JTCB). The primary concern of the JTCB is the employment of operational fires and shaping the joint force's battlespace in the JOA, including fires supporting OCA attack operations. The JTCB may simultaneously address at least three ATO cycles that are either being planned or are about to be executed.
- **Immediate Attack Operations.** The quicker the joint force can locate, identify, and target the adversary air and missile threats, the quicker they can be attacked and defeated. ~~These operations are conducted over, through, or in adversary territory.~~

Immediate missions are conducted against emerging mobile and TSTs and require the execution of mutually supporting tasks (e.g., detection, acquisition, and identification, tracking and attack). These operations rely on sensor systems, a responsive near real time sensor management and communications network and weapon systems capable of attacking targets at great ranges as soon as adequate targeting information is presented. ~~Execution of immediate attack operations is centrally controlled, decentrally executed and governed by ROE and established procedures.~~

- **Target Acquisition.** Acquisition and tracking systems ~~receive~~ may utilize cuing from ~~a~~ wide-area and local surveillance systems and receive warning data from other intelligence sources. Acquisition supports target identification and discrimination and timely target engagement by accurately locating and monitoring targets and transmitting information relative to target movement.

- **Target Detection.** In the case of

*The JFACC's recommendation and the JFC's decision on apportionment determine the amount of effort made available for OCA attack operations.*

## Chapter IV

1 TMs, detection ~~requires identification~~ 33  
2 ~~of launch signatures and the accurate~~ 34  
3 ~~location of the launch system. Much~~ 35  
4 ~~of this same data will be also shared~~ 36  
5 ~~between active and passive defense~~ 37  
6 ~~forces can be accomplished through~~ 38  
7 ~~identifying launch signatures or~~ 39  
8 ~~intelligence sources such as~~ 40  
9 ~~measurement and signature~~ 41  
10 ~~intelligence or communications~~ 42  
11 ~~intelligence.~~ To support attack 43  
12 operations in all environments, joint 44  
13 forces should diminish adversary 45  
14 countermeasures while capitalizing 46  
15 on distinctive equipment signatures. 47  
16 Surveillance capabilities should 48  
17 integrate national level intelligence 49  
18 with theater level capabilities. Space, 50  
19 sea, air and ground based area and 51  
20 point surveillance sensors will also be 52  
21 key to establishing a comprehensive 53  
22 surveillance network. Detection 54  
23 involves a systemic search of areas of 55  
24 interest identified during the IPB. 56  
25 After detection, warning or location 57  
26 data should be passed immediately to 58  
27 joint and component intelligence and 59  
28 operations centers, executing units 60  
29 and air and surface search equipment. 61  
30 Simultaneously, tactical warnings 62  
31 should also be provided to potential 63  
32 friendly-targeted assets.

•• **Identification.** Identification of air and TM platforms and supporting nodes requires management of target movement data, determination of the type of system employed, and discrimination of the launch and support systems from decoys. Target ID also requires the use of predictive intelligence including the identification of potential future target locations, area limitation analysis, and automated cuing of sensors to threatening targets.

• **Attack.** Observed ~~enemy-adversary~~ activity should trigger timely execution. ~~Enemy-Adversary~~ targets identified in the IPB database are included in the joint force's plan for preemptive strikes or operations at the onset of hostilities. Targets acquired are attacked in accordance with JFC guidance. The goal is to attack immediate targets as they present themselves.

• EW is employed against ~~adversary~~ enemy C2, communications, surveillance and target acquisition to disrupt their air and missile

*For OCA attack operations, the JFACC makes an effective decision for employing the best capable attack asset.*

operations. The primary goal of EW in attack operations is to blind an adversary thereby setting the conditions to successfully attack air and missile related targets.

- ~~OCA attack operations are executed by component level forces capable of attacking targets with both lethal and nonlethal means to achieve the desired effects.~~ ATO. The ATO is should be flexible enough to deal with immediate ~~OCA missions attack operations.~~ The combat operations division of the JAOC is responsible for adjusting the ATO in order to deal with real time developments in the battlespace. One method used in the ATO to permit this flexibility is designating forces in the ATO as either ground alert or airborne alert. These on-call assets can then be tasked real time against immediate targets.

- ~~TSTs. A critical factor in attacking TSTs is the requirement to conduct all the steps of the joint targeting cycle in a short time. The authority to engage TST OCA targets should be delegated to the C2 node that has the best information or situational awareness to perform the mission and direct communications to the weapon systems. Placing the appropriate level of battlespace awareness at subordinate C2 nodes can streamline the C2 cycles and allow timely engagement of OCA targets. For some types of TST, the time available to acquire, target, and attack may be very brief. In this case, an accelerated process is normally used. OCA attack operations are a continuous cyclic process. The cycle for a preplanned target may take hours even days, but successful prosecution of TSTs requires this cycle to be completed in a matter of~~

~~minutes. To achieve this time compression, the JFC should provide guidance on TSTs and specify priorities for attacking them. The JFC guidance should enable the phases of the targeting cycle to be performed simultaneously rather than sequentially. For OCA attack operations, the JFACC makes an effective decision for employing the best capable attack asset. Delegating authority and placing the appropriate level of C4I systems with subordinate commanders can streamline decisions to allow for timely engagement of targets associated with OCA attack operations.~~

*For more information ~~on JTTP for TSTs~~ see JP 3-60, Joint Doctrine for Targeting.*

### 3. ~~Fighter Sweep and Fighter Escort~~

~~The fighter sweep is an offensive mission by fighter aircraft to seek out and destroy adversary aircraft, cruise missiles, or targets of opportunity in an allotted sector. Fighter escorts is likewise an offensive mission where fighters provide specific protection against adversary fighter aircraft. Escort aircraft are normally assigned to protect specific groups of friendly aircraft while en route to or from a target area (for example, escort for air interdiction or strategic attack). Escort aircraft may also protect airlift, air to air refueling, EW, C2, search and rescue, and SOF infiltration/exfiltration aircraft. The fighter sweep is an offensive mission by fighter aircraft to seek out and destroy adversary aircraft or airborne targets of opportunity in an allotted sector. The need for fighter sweep missions will depend on the air and missile threat and the objectives of the joint air operations plan.~~

## Chapter IV

1  
2 a. **Threats/Targets.** ~~The threats for~~  
3 ~~fighter sweep and fighter escort missions~~  
4 ~~are any adversary aircraft which have the~~  
5 ~~capability to disrupt or destroy primary~~  
6 ~~mission aircraft. Primary mission aircraft~~  
7 ~~are those aircraft on OCA attack,~~  
8 ~~interdiction, CAS, or strategic attack~~  
9 ~~missions. During sweep and escort~~  
10 ~~missions fighters are only concerned with~~  
11 ~~adversary aircraft airborne in their specific~~  
12 ~~sector or those adversary aircraft which~~  
13 ~~could be a threat to the strike package they~~  
14 ~~are protecting. An escort aircraft can also~~  
15 ~~provide protection against a SAM threat.~~  
16 ~~These SEAD capable aircraft are~~  
17 ~~designated to protect a specific aircraft or~~  
18 ~~package of aircraft against the SAM threat~~  
19 ~~in that sector. The fighter sweep is a~~  
20 ~~flexible air mission because threats/targets~~  
21 ~~can be anywhere in the allotted sector.~~  
22 ~~Fighter sweeps should only be planned~~  
23 ~~into areas where the threat from surface-~~  
24 ~~based air defenses has been minimized, if~~  
25 ~~not eliminated, through tactics or attrition,~~  
26 ~~to enable the concentration of assets on~~  
27 ~~the destruction of adversary aircraft and~~  
28 ~~airborne targets of opportunity.~~

29  
30 b. **Resources.** ~~Any fighter aircraft with~~  
31 ~~air to air ordnance can conduct fighter~~  
32 ~~sweep and escort missions against~~

33 ~~adversary fighter aircraft. Aircraft with~~  
34 ~~beyond visual range ID systems and radar~~  
35 ~~optimized against air to air threats are~~  
36 ~~desired for the sweep and escort role.~~  
37 ~~Fighter sweep and escort missions are~~  
38 ~~more effective when early warning radar~~  
39 ~~assets such as the AWACS or GCI assets~~  
40 ~~are used in conjunction with the fighters.~~  
41 ~~Escorts against SAMs and AAA require~~  
42 ~~specialized equipment specifically~~  
43 ~~designed to detect, identify, and suppress~~  
44 ~~adversary air defense radar. This is~~  
45 ~~normally localized suppression and is~~  
46 ~~covered in more detail in the SEAD~~  
47 ~~section. Primary mission aircraft are~~  
48 ~~normally those same fighter aircraft used~~  
49 ~~for OCA attack, interdiction, CAS,~~  
50 ~~strategic attack and escort missions.~~  
51 ~~Friendly early warning and GCI radar~~  
52 ~~sites, and airborne warning and control~~  
53 ~~aircraft should be tasked to support the~~  
54 ~~mission. This may be especially~~  
55 ~~important when aircraft with beyond~~  
56 ~~visual range ID systems and weapons are~~  
57 ~~used, or when significant numbers of~~  
58 ~~adversary aircraft may be encountered.~~  
59 ~~SEAD aircraft are not normally required~~  
60 ~~because the adversary surface-based air~~  
61 ~~defenses should not be a threat (through~~  
62 ~~tactics or attrition). Based on mission~~  
63 ~~duration and distances, aerial refueling~~

### 58TFS FIGHTER SWEEP/ESCORT DURING DESERT STORM

65  
66  
67  
68 “The plan’s essence — as far as the 58th was concerned — was that twenty  
69 F-15s, in line with strategically positioned four ships from several squadrons,  
70 were going to be the first air-to-air fighters to sweep across the Iraqi border after  
71 the STEALTHs, F-15E bombers, and TOMAHAWK missiles had made a surprise  
72 attack mostly on Baghdad’s vital command and communications centers,  
73 hopefully knocking them out and, with them, the country’s air defenses.

74  
75 Then, as the bombers, done with their surprise missions, sped back to safety  
76 south over the border, the EAGLES, including two four ships from the 58th would  
77 charge in over their top, engaging any **adversary-enemy** fighters . . . and clearing  
78 a path for the waves of conventional nonstealth bombers and other warplanes  
79 that would be following.”

80  
81 SOURCE: *Wings of Fury* by Robert Wilcox, 1996, pp 220-221  
82

may also be required. EW may be used to enhance the element of surprise/disruption, and give the attacking force a tactical advantage.

**c. Execution.** Fighter sweep involves employing fighter aircraft over designated areas of adversary territory to seek out and destroy the adversary's aircraft. Fighter sweep seeks to eliminate the adversary's tactical options and should be closely coordinated with other air operations to permit long range identification and beyond visual range weapons employment. Autonomous sweep operations use only fighter fire control radar and ID systems; however, sweep is more effective when combined with external GCI or AWACS and when off board identification systems are used. Escort employs fighter aircraft in a direct support role to strike aircraft or high value airborne assets. Their primary mission is to protect the designated platform against adversary air to air and the surface to air threat. Modern fighters often practice self-escort through mixed carriage of long range air to air missiles along with their air to surface weapons load. The goal is not necessarily destruction of adversary aircraft. The level of force engagement and protection is determined by the actions of the threat aircraft and SAMs. If the adversary chooses not to attack because a fighter escort is present or is screening the force from the adversary, then the objective of OCA escort has been met. Conversely, escort fighters must exercise caution against being drawn away from the force by diversion or decoy, thus leaving the force vulnerable to adversary aircraft and SAMs/AAA. Although a flexible air mission, the fighter sweep involves employing fighter aircraft over hostile territory. Fighter sweep missions should normally follow a series of OCA attack and SEAD operations aimed at neutralizing/destroying the adversary offensive and defensive aircraft

and missiles threats. However, a sweep may be synchronized into a rapid series of OCA operations (including attack, SEAD and escort missions), or into other offensive air operations (i.e., interdiction, strategic attack, etc.). Normally, detailed planning and coordination, good intelligence and robust C2, including real time threat warnings, are essential to prevent surprises by the adversary and to ensure synchronization or deconfliction with other friendly operations. Ground or airborne warning and control assets enhances overall effectiveness, but if those supporting resources are not available, execution of autonomous fighter sweeps with fighters using only their own fire control radar and ID systems are possible.

#### **4. Fighter Escort**

The fighter escort mission is critical to offensive air operations. Fighter escorts fly in direct support of primary mission aircraft en route to and from a target area (i.e., for air interdiction, OCA attack, SEAD, etc.). Escort fighters may also protect airlift, air refueling, EW, C2, combat search and rescue, and SOF aircraft. Escort missions may also be planned as DCA missions to protect high value airborne assets (i.e., AWACS, RIVET JOINT, etc.) from potential adversary fighter attack.

**a. Threats/Targets.** The threats for fighter escorts are any adversary aircraft with a capability to disrupt or destroy the primary mission aircraft. Escort fighters target only those airborne aircraft that threaten the primary mission. Fighter escorts in conjunction with their supported aircraft must avoid the direct threat of adversary surface-based air defenses. If SAM/AAA threats cannot be avoided, the threat and risk to the primary mission and fighter escorts requires a SEAD mission in support.

*Fighter escorts provide protection against adversary fighter aircraft and are normally assigned to protect specific groups of friendly aircraft.*

**b. Resources.** Dedicated air-to-air fighters, especially those with beyond visual range ID systems and weapons, and radar optimized for air-to-air threats are best suited for the escort mission. However, any fighter with air-to-air ordnance and fire control radar can conduct escort missions. Escort missions are more effective when ground and airborne early warning or GCI radar assets are available for threat warnings. Airborne C2 assets are normally required especially during rapidly synchronized/complex operations. The duration of the escort mission may require aerial refueling support for the escorts, even if not for the primary mission or other support aircraft. EW support may also be required to disrupt the effectiveness of adversary acquisition, tracking and interception capabilities.

**c. Execution.** Air planners must evaluate the threat posed by the adversary counterair forces and determine the type and size of fighter escort force required, because the same air assets are usually shared for DCA operations. The planners must also coordinate the support required by the escort force (i.e., air refueling, EW,

C2, etc.). The specific responsibilities of the fighter escort force must be clear to all participants. In direct support, their mission is to protect the primary mission force, and not necessarily the destruction of adversary aircraft. If the adversary chooses not to attack because a fighter escort is present, then the objective of OCA escort has been met. Conversely, escort fighters must exercise caution against being drawn away from the escorted force by diversion or decoy, leaving that force vulnerable to other adversary aircraft.

### 5. ~~J~~-Suppression of Enemy Air Defenses ~~EAD~~ Operations

SEAD is any activity that neutralizes, destroys, or temporarily degrades adversary surface-based air defenses by destructive and/or disruptive means to allow friendly operations freedom of action through adversary airspace. SEAD operations are based upon the JFACC's joint air operations plan (JAOP) and the components' suppression needs, target priorities, and availability of appropriate suppression means. ~~Joint suppression of~~

*Air defense threats can encompass many systems normally integrated in a national, alliance, or subnational architecture called an IADS. Robust IADS normally require SEAD to enable attack operations.*

1 ~~enemy air defenses (J-SEAD) is a broad~~  
2 ~~term that encompasses all SEAD activities~~  
3 ~~provided by components of a joint force in~~  
4 ~~support of one another. SEAD and J-~~  
5 ~~SEAD are not ends in and of themselves~~  
6 ~~but, rather, they are a subset of OCA~~  
7 ~~operations, which enable all friendly air~~  
8 ~~operations. J-SEAD operations can fall~~  
9 into three categories: AOR/JOA air  
10 defense system suppression, localized  
11 suppression, and opportune suppression.  
12 AOR/JOA air defense system suppression  
13 creates increasingly favorable conditions  
14 for friendly operations by disabling  
15 adversary air defense systems or major  
16 capabilities of those systems. Localized  
17 suppression operations normally have  
18 specified time and space limitations  
19 because they support specific operations  
20 or missions. Under localized suppression,  
21 SEAD aircraft may escort specific  
22 aircraft(s) to protect them from a SAM  
23 threat in that sector. Opportune  
24 suppression includes self-defense and  
25 offensive attacks against adversary air  
26 defense targets of opportunity. SEAD  
27 objectives are specified by the JFC, who  
28 will consider the unique capabilities of  
29 each component to contribute to

30 counterair operations. SEAD operations  
31 require correct identification of adversary  
32 systems to prevent fratricide.  
33

34 a. **Threat.** Air defense threats can  
35 encompass many systems normally  
36 integrated in a national, alliance, or sub-  
37 national architecture called an IADS.  
38 Potential threat IADS have become  
39 increasingly complex and can differ  
40 widely from country to country in terms of  
41 organization, sophistication, and  
42 operational procedures. Any potential  
43 threat IADS needs to be analyzed in depth  
44 to identify its command structure and  
45 potential strengths and weaknesses. Since  
46 the end of the Vietnam conflict US forces  
47 have expended considerable effort to  
48 develop counter-IADS forces, which  
49 generally fit in the SEAD mission area.  
50 These combat-proven efforts are well  
51 known to US potential adversaries and  
52 have in turn led to countermeasures and  
53 tactics based on US demonstrated  
54 procedures, capabilities, and weapons  
55 characteristics. SEAD operations target  
56 the following components of adversary  
57 IADS:  
58

## Chapter IV

- IADS C2 nodes/centers

- SAM sites

- AAA

- Early warning radars

- SAM storage bunkers

- Operations and maintenance personnel.

- Adversary IADS attempt to disrupt or neutralize friendly aircraft before they threaten adversary forces and critical assets. They may provide protection for high value assets, strategic targets, C2 nodes and critical military units. Adversary IADS procedures may include jamming aircraft navigation, communication, and target acquisition systems to degrade effectiveness. To accomplish these tasks, adversary IADS traditionally exercise rigid control over air defense activities. Air defense commanders located in centralized C2 posts provide warning and cueing, assign targets, and control weapons readiness using overlapping and redundant communication links.

- Doctrine for mobile IADS elements may stress echeloning of forces in depth and include tactical and strategic SAMs and AAA systems. IADS have developed into hybrid organizations, which frequently combine adversary, neutral and friendly radar and C2 systems. IADS command structure may be a rigid, centrally controlled organization or a flexible, locally run operation. Traditional radio based C2 is now being supplemented by communications over landline (cable), microwave, cellular, and

internet systems. Each of these areas presents new challenges to SEAD planners.

- Passive technologies are now available that will give US forces little warning prior to engagement by IADS forces. Adversaries have become adept at CCD which complicate SEAD targeting. SAM forces have become increasingly mobile, with some potential adversaries demonstrating less than ten minutes required from shoot to move.

- Recent SAM systems have been dramatically improved in both range and capability and some older systems have received substantial upgrades that continue to make them serious threats to US forces. Long-range SAMs are usually located near high-value targets and provide barrier, area, and point defense coverage. Their long range and mobility mean these systems could provide air defense coverage over the forward edge of the battle area at various stages of the conflict and threaten friendly airborne platforms well into friendly airspace. Adversary doctrine will likely place a high priority on the suppression or destruction of airborne C2, standoff jamming, and reconnaissance assets. Recent developments in long range SAMs, some with antiradiation guidance, place these aircraft at risk in many scenarios.

- MANPAD Systems include short-ranged SAMs that may be guided by electro-optical or RF methods. MANPADs will probably present the primary threat for air assault, airlift, and CAS operations. Their proliferation and lack of warning

## Offensive Counterair Execution

~~make them a serious threat to all fixed and rotary wing aircraft operating at low and medium altitudes, particularly in areas that might otherwise be considered nonhostile, such as during takeoff and landing. The maneuver of ground forces must be a key consideration when planning J-SEAD operations. Although SAM and AAA systems sometimes fail to keep pace with high tempo maneuver operations, they eventually establish coverage over these maneuvers. J-SEAD planners should expect MANPAD and AAA coverage wherever adversary forces are encountered. In addition, fratricide issues need to be addressed when friendly ground forces are in the proximity of the adversary, particularly where ARMs are being used.~~

b. **Resources.** Each component has its own unique capabilities to suppress enemy air defense systems. Historically, the component directly affected by the threat has assumed the immediate responsibility for suppressing adversary air defense threats. However, the distinct capabilities provided by each component, the diverse combinations these capabilities offer, and the aggregate of total J-SEAD capabilities allow US forces to choose the best means and ways to conduct particular J-SEAD operations from the array of available options. Some of these options include aircraft with ARMs and other air-to-surface munitions, EW, attack helicopters, direct or indirect fires (including mortars, artillery, missiles, or

naval surface fire), and direct action by SOF. J-SEAD operations can be accomplished through destructive and disruptive means.

• **Destructive Means.** Destructive means seek the destruction of the target system or operating personnel ~~and increase aircraft survivability.~~ However, this may place large demands on the available combat capabilities/forces. Examples of destructive SEAD capabilities are bombs, ~~air to surface~~ air-to-surface and surface-to-surface missiles, air scatterable mines, and artillery.

• **Disruptive Means.** Disruptive means temporarily deny, degrade, deceive, delay, or neutralize enemy air defense systems to increase aircraft survivability. Disruptive means may be either active or passive.

•• Active means include electronic attack, ARMs, directed energy, electromagnetic jamming, electromagnetic deception, expendables (chaff, flares, and decoys) and tactics such as deception, avoidance, or evasive flight profiles. In addition, unmanned aerial vehicles can be used to actively employ disruptive means.

•• Passive means include emission control, camouflage, ~~infrared~~ IR shielding, warning receivers, and material design features.

*Each component has its own unique capabilities to suppress enemy air defense systems.*

c. **Execution.** The JFACC accomplishes planning and coordination of J-SEAD based on the JFC's operation or campaign objectives. The following three paragraphs describe execution of the three categories of J-SEAD: JOA air defense system suppression, localized suppression, and opportune suppression.

- **JOA Air Defense System Suppression.** JOA air defense system suppression efforts should target high payoff air defense assets that will result in the greatest degradation of the adversary's total system. These targets include AWACS, radar and associated C2 systems for early warning, GCI sites, and long range SAM systems. ~~The objectives of JOA air defense system suppression will depend upon the type of air operations (interdiction, counterair, maritime, etc.) planned to support the JFC operation or campaign plan. The immediate objective of JOA air defense system suppression operations is to permit effective friendly air operations by protecting friendly airborne systems,~~

~~disrupting the cohesion of adversary air defenses, and establishing flexibility for friendly operations on both sides of the forward line of own troops. The immediate objective of JOA air defense system suppression operations is to disrupt adversary IADS throughout the JOA; deny the adversary the ability to integrate his air defenses. The duration and level of disruption of adversary IADS will depend upon the JFC's objectives and the sophistication of adversary IADS. Because the results of JOA air defense system suppression can have a significant impact on friendly operations, these operations may operations typically~~ have a higher priority than localized SEAD objectives.

- **Localized Suppression.** Localized suppression operations are normally confined to geographical areas associated with specified ground targets or friendly transit routes. These operations contribute to local air superiority, facilitating joint operations in the area. Localized suppression operations occur

## Offensive Counterair Execution

throughout the JOA for all components and have time and space limitations. Although they protect specific operations or missions their effects may extend beyond the objective time period.

### •• ~~Preplanned~~ Planned Localized

**Suppression.** The SEAD process is based upon the JFACC's JAOP and the determination of suppression needs, target priorities, and availability of appropriate suppression means. Localized SEAD coordination occurs at all echelons. Localized suppression requests are processed from the lowest echelon of command to the highest using the appropriate air control system. Liaison elements located in the JAOC aid this effort. A requesting echelon or component must first consider what organic SEAD systems are available. When the requirements exceed the capability or availability of their systems, the requesting component passes the requirements through its respective chain of command to the JFACC for resolution. Units requesting air support ~~will~~ are required to identify known or suspected air defense systems that could threaten the mission. SEAD requests will also include these ~~defense~~ defensive systems and identify other supporting targets that likewise cannot be engaged with organic capabilities/forces.

•• **Immediate Missions.** Threat assessment and suppression requirements, usually destructive in nature, must be made quickly when processing a request for SEAD air support. Procedures for requesting immediate localized suppression are the same as those for CAS. If a surface force cannot support the

SEAD requirement, the component control center passes the request to the JFACC through the appropriate air control system for immediate SEAD support considerations.

• **Opportune Suppression.** Opportune suppression is unplanned and includes aircrew self-defense and attack against targets of opportunity. The proliferation of highly mobile threat systems to the battlefield will probably lead to an increase of opportune suppression. Any movement by threat systems from pretargeted locations will change localized suppression into opportune suppression. The JFC or higher authority will establish the ROE for opportune suppression. Realizing that the window to engage highly mobile targets may be fleeting, due concern should be given to establishing ROE that will allow the rapid prosecution of threats before they have the opportunity to move or conceal themselves again. Opportune suppression is a continuous operation involving immediate response to acquired ~~air~~ defense targets of opportunity. In cases where air assets are not available or not required, the component commander establishes priorities for opportune suppression. These priorities are forwarded from the designated fire support coordinator at component-level headquarters to the executing commands. The following are the different types of opportune suppression.

•• **Aircrew Self-defense.** ~~Unless otherwise dictated by the laws of war, ROE for self defense should be as liberal as possible, consistent with the safety of friendly forces. An aircraft commander has the inherent authority and is obligated to use all necessary~~

## Chapter IV

means available and to take all appropriate actions in self-defense of the unit and other US forces in the vicinity. Nothing in the SROE, theater-specific ROE or special instructions (SPINS) limit this inherent right and obligation. For further guidance, see CJCSI 3121.01A, *Standing Rules of Engagement for US Forces*.

•• **Targets of Opportunity.** SEAD targets of opportunity are those adversary air defense systems detected by surface or airborne sensors or observers within range of available weapons and not yet targeted. Many SEAD efforts by surface forces may be against targets of opportunity. Surface and air weapon systems may suppress air defense targets of opportunity whenever capabilities, mission priorities, and ROE permit. Such suppression operations must be in accordance with established rules and fire support coordination measures. The purpose of SEAD ROE is to enhance effective SEAD while minimizing risks to friendly forces.

•• **Targets Acquired by Observers or Controllers.** Combat elements may often be in good position to acquire SEAD targets of opportunity. Observers, spotters, controllers, and liaison officers from the components have the authority to request suppression for SEAD targets of opportunity. Such personnel may include ~~Air Force air liaison officers, enlisted~~ terminal attack controllers, airborne ~~forward air~~ controllers and observers, tactical air control parties, Marine assault support coordinators, ~~and airborne tactical air controllers,~~ artillery forward observers, ~~infantry commanders, aerial observers,~~ UAV

operators, Army fire support teams and combat observation/lasing teams, ~~and~~ STRIKER platoons. The observers or controllers will forward these requests through their respective fire support channels. Requirements should first be passed to suppression systems that belong to or support the unit acquiring the target because they can respond immediately. If the suppression requirement exceeds the capabilities of the ground forces, the immediate request will be sent via the air request net to the component control centers.

•• **Targets Acquired by Aircrews.** When aircrews have acquired SEAD targets of opportunity but have not engaged them because of mission priorities, system capabilities, or SEAD ROE, they pass the information to the agency controlling their mission. This agency immediately passes the targeting data through the appropriate system or systems to coordinate with the force best suited for targeting.

d. **Surface-to-Surface Suppression Capabilities.** Based on the JFC guidance, the ~~ground and naval land and maritime~~ components' FSEs and fire support coordination centers will determine the weapon systems available to conduct AOR/JOA localized suppression. Examples of these capabilities/forces include field artillery, mortars, naval surface fire, attack helicopters, EW, and ~~surface-to-surface~~ ~~missiles~~ SSMs. Components need to coordinate employment of these suppression systems to ensure they meet mission requirements and do not interfere with other planned operations. Component liaison elements, such as the BCD located in the JAOC assist localized suppression operations by providing the means to request surface fire

*Component commanders will use their organic assets to locate, identify, and attack SEAD targets within their AO whenever possible.*

1 support. The component commanders  
2 continually update lists of potential SEAD  
3 targets in their areas of interest. The list of  
4 targets includes target location, desired  
5 effects, timing, and sequence of attack.  
6 Component commanders will use their  
7 organic assets to locate, identify and  
8 attack SEAD targets within their AO  
9 whenever possible. In many cases  
10 however, only the JFACC has assets to  
11 specifically find and identify ~~J~~-SEAD  
12 targets. Therefore a rapid and free  
13 exchange of ~~J~~-SEAD target information  
14 between the JFACC and ~~Service~~-other  
15 components commanders is required for  
16 effective surface suppression. During the  
17 planning and execution of CAS, tactical  
18 air control parties, ~~air and naval gunfire~~  
19 ~~liaison companies~~, and ~~other~~ fire support  
20 agencies identify potential local SEAD  
21 targets and request SEAD fire support. A  
22 preplanned request for ~~J~~-SEAD should  
23 also identify known or suspected enemy  
24 air defense locations to, from, and around  
25 the target area. Each echelon handling the  
26 request refines and updates threat data if  
27 able. The request for air support contains  
28 this updated data, along with the type of  
29 suppression desired by the requesting  
30 component.  
31

### 32 e. Surface Component Suppression

33 **Requests.** For those SEAD targets that  
34 surface components cannot attack, they  
35 may request suppression support from the  
36 JFACC. The component commanders  
37 continually update and submit lists of  
38 potential SEAD targets in their areas of  
39 interest for the JFACC to attack. The list  
40 of targets includes target location, desired  
41 results, timing, and sequence of attack.  
42 Component liaison elements are  
43 responsible to their respective command  
44 for consolidating their component's  
45 SEAD target priorities. Surface  
46 components should also identify SEAD  
47 requirements for all air support that they  
48 request. A ~~preplanned~~ request for air  
49 support ~~to the air component~~ should  
50 identify known or suspected enemy air  
51 defense locations to, from, and around the  
52 target area. Each echelon handling the  
53 request refines and updates threat data if  
54 able. The request for air support contains  
55 this updated data, along with the type of  
56 suppression desired by the requesting  
57 component.  
58  
59  
60

## Chapter IV

### 6. Command, Control, Communications, Computers, and Intelligence Systems

Effective ~~OCA operations require reliable C2 capability that integrates air, surface, subsurface and space-based assets. The hardware and software family of systems that enable integration between components are commonly referred to as C4I.~~ These resources systems should be capable of rapidly exchanging information, interfacing with components, and displaying a common operational picture to all components of concern. OCA operations are often conducted deep within adversary territory, relying on integrated C4I systems for deconfliction with other operations. Against fixed targets, OCA operations place great emphasis on detailed planning, accurate and timely intelligence, target selection and time-over-target deconfliction, and ROE. This emphasis enhances mission effectiveness while minimizing fratricide and interference with other operations. A responsive, integrated system is required to assign the optimum weapon system against mobile counterair ~~TSTs targets~~ such as SAMs or ballistic and cruise missile launchers. Because the situation is constantly changing and cannot be accurately predicted, C4I systems constantly monitor the status of offensive weapons, sensors, and other systems to maintain full flexibility to modify preplanned COAs to execute timely attacks. ~~C4I for OCA must be accomplished using relies on~~ existing joint and Service C4I systems and resources efficiently to ensure integration with other operational functions and to optimize the use of resources. The C4I system must provide rapid communication among intelligence assets. The fusion of decision-making facilities, warning systems, and weapon systems provides a

capability for rapid coordination between commanders and their forces. C4I capabilities must support the principles of centralized planning and decentralized execution by forces assigned OCA missions.

a. ~~Resources.~~ Resources inherent in effective OCA operations must be interoperable. C4I systems, facilities, procedures, and organizations are built on existing systems and integrate applicable joint capabilities. The JFC should be particularly sensitive to the need to exercise C4I interoperability among joint force components during peacetime joint and multinational exercises. However, new C4I functions, equipment, and procedures may be required to accommodate the changing characteristics and signatures associated with the rapidly evolving threat. These new C4I capabilities and procedures should be integrated with existing and planned C4I systems as requirements are developed. C4I systems should be able to determine accurate locations of adversary air and missile threats such as aircraft, missile launchers and supporting infrastructure. They must be able to transmit targeting data to attack systems and facilitate accurate combat assessment. Requirements. OCA operations rely on existing joint and Service C4I systems. Supporting C4I systems must provide rapid communication among OCA assets. Fusing decision-making facilities, warning systems, and weapon systems provides a rapid coordination capability. C4I systems must support the centralized planning and decentralized execution. C4I systems supporting OCA operations must be interoperable. C4I systems must transmit targeting data to attack systems and facilitate accurate combat assessment.

## OCA THE FIRST 24 HOURS OF DESERT STORM

“DESERT STORM began officially at 0300 local time on the night of 17 January. Actual commitment to hostilities had begun earlier. On the morning of 16 January, at 0630 local time, seven B-52G bombers armed with conventionally armed air-launched cruise missiles (ALCM-Cs) took off from Barksdale AFB, Louisiana, for the Persian Gulf. At 0130 on the 17th, Navy ships in the Gulf launched TOMAHAWK cruise missiles toward their targets in Iraq. Shortly before H-hour, Air Force special operations forces PAVE LOW helicopters led Army APACHE helicopters in attacks against two Iraqi early-warning radars. F-117A STEALTH fighters had already swept undetected past the border into Iraq. The F-117s attacked Iraqi air defense sites, and together these two attacks punched a hole in the Iraqi air-defense network that allowed the attacking armada to sweep into Iraq. F-15C and F-14 air superiority fighters led follow-on waves and established combat air patrols (CAP) to intercept any opposing airborne Iraqi aircraft — of which there were only twenty. Some F-15s had pushed into Iraq early in response to a scramble by the Iraqi air force. Although the Iraqis sent up their best air-defense aircraft the first night — MIG-25s, -29s, and MIRAGE F-1Es — they had limited nighttime capability and inferior weapons, and they were trounced.”

#### b. Intelligence Support

**Requirements.** The intelligence requirements dictate a wide-area surveillance of the AOR/JOA to provide current, integrated, accurate, and timely all-source information of adversary capabilities and activities. OCA intelligence requires interface with existing national and theater sensor and surveillance networks. ~~The system should accommodate a variety of Service, national, and/or allied communications systems. Surveillance capabilities should integrate national level intelligence with theater level capabilities. Space, sea, air and ground based area and point surveillance sensors will also be key to establishing a comprehensive surveillance network.~~ The intelligence system is vital to the decision-making cycle and must support the status, assessment, planning, warning, and IPB functions, as well as target prioritization and engagement decisions. The intelligence function is

carried out through a geographically dispersed network in which national, theater, and Service systems are interconnected to form a disciplined and responsive information gathering and dissemination structure. Though the functional systems (sensors, decision support, or fusion centers and firing units) may be dissimilar, interoperable communications and software must be provided.

**c. Execution.** ~~During operations, the C4I system should rapidly disseminate intelligence to the components and support OCA operations with a rapid targeting capability. C4I for counterair should be integrated into the overall theater communications network and designed to avoid duplicative operations and fratricide, while supporting the tenet of centralized control and decentralized execution.~~ Component organizations conducting OCA operations should attempt to maintain interface and central

## Chapter IV

1 control authority. The preparation and  
2 planning process within the C4I  
3 framework focuses sensor, surveillance,  
4 and intelligence management to allow  
5 target acquisition and tracking of the  
6 adversary systems and their supporting  
7 operations. Intelligence should be able to  
8 provide near real time data on adversary  
9 targets; operating bases; missile launch,  
10 load, and hide sites; EW systems;  
11 command, control, communications, and  
12 computers facilities; surveillance and  
13 control systems; and logistic and  
14 infrastructure support. The C4I systems  
15 should be able to detect and disseminate  
16 information that indicates adversary air  
17 and missile launch preparations and  
18 should be able to pass the pre-launch,  
19 launch, and post-launch warning to  
20 friendly units. Prelaunch and launch  
21 warnings provide for the alert and  
22 increased readiness of friendly defensive  
23 assets and preplanned offensive and  
24 passive countermeasures employment.  
25 Increasing the readiness posture includes  
26 performing the vital operating functions  
27 that prepare weapon systems, ISR ~~target~~  
28 ~~acquisition~~-assets, and C2 nodes for the  
29 level of adversary activity anticipated.  
30 Once adversary air and missile activities  
31 are detected, the preparation and planning  
32 measures provide a capability for parallel  
33 defensive and offensive responses.  
34 Adversary air and missile activity  
35 observed and identified through sensor  
36 and surveillance systems (national,  
37 theater, and tactical) keys the C4I process  
38 that uses communications interfaces to  
39 provide near real time defensive and  
40 offensive counterair response. Data is  
41 made available in near real time to C4I  
42 centers, systems, and forces supporting  
43 counterair operations. Simultaneously,  
44 while adversary air and missiles are in  
45 flight, updated adversary launch locations  
46 and target database information are passed  
47 to the appropriate ~~command and control~~  
48 ~~C2~~ and attack systems and launch  
49 warnings are provided to all units or  
50 commands within the theater. Depending  
51 on the capabilities of the sensor and  
52 surveillance systems and the source and  
53 quality of the intelligence, cueing of  
54 additional systems may be necessary to  
55 provide more refined adversary air and  
56 missile threat data to ensure accurate  
57 targeting. National or theater sensor and  
58 surveillance assets may be able to detect,  
59 footprint, or search areas that will then  
60 require more refined ISR activities by  
61 theater and tactical assets. Friendly aerial  
62 reconnaissance, ground surveillance  
63 systems, and other intelligence assets  
64 requiring cueing are focused rapidly to  
65 achieve the necessary accuracy for IPB  
66 targeting objectives.

## APPENDIX A

### NO-FLY ZONE ENFORCEMENT

1 Enforcing a no-fly zone (NFZ) is a  
2 unique mission that involves preventing  
3 an adversary from flying in a certain  
4 airspace. The NFZ could be above  
5 adversary territory or in a neighboring  
6 country. Usually the mission involves a  
7 joint and multinational effort working  
8 with several types of aircraft from  
9 different Services and/or nations. NFZ  
10 enforcement can involve friendly,  
11 adversary, and neutral fixed- or rotary-  
12 wing aircraft. Normally, NFZ  
13 enforcement consists of a mix of  
14 counterair missions. Depending on the  
15 threat, NFZ enforcement involves SEAD,  
16 OCA sweep and/or escort, and OCA  
17 attack operations. The escort aircraft  
18 protect strike aircraft, which are armed  
19 and ready to react to violations of the  
20 NFZ. Escort aircraft are often tasked to  
21 protect high value airborne aircraft flying  
22 over adversary airspace. One example of  
23 a high value airborne aircraft is the U-2,  
24 which is used in a surveillance role in a  
25 ~~no-fly zone-NFZ~~ enforcement operation.  
26 Some DCA type missions, such as HVAA  
27 protection, fly over friendly as well as

28 adversary territory. These combat air  
29 patrol aircraft protect the AWACS,  
30 RIVET JOINT, tanker aircraft, and other  
31 HVAA.

32  
33 A JAOC plans and directs the  
34 operations for NFZ enforcement. A daily  
35 ATO is published along with an ACO and  
36 SPINS. The combatant commander  
37 establishes ROE for NFZs. Because of  
38 the unique nature of NFZ enforcement  
39 operations, the ROE is tightly controlled.  
40 There are numerous political  
41 considerations ~~effecting-affecting~~ the  
42 ROE. Operations are closely controlled  
43 through the ~~airborne~~-controlling agency  
44 (AWACS, ~~or E-2, or CRC~~), which has  
45 direct communications with the JAOC  
46 director. This allows centralized control  
47 of operations.

48  
49 In addition to prohibiting the adversary  
50 ~~to-from~~ flying aircraft in a certain  
51 airspace, NFZ enforcement can also limit  
52 the deployment, employment, and

Usually NFZ missions involve a joint and multinational effort working with several types of aircraft from ~~difference-different~~ Services and nations.

## Appendix A

1 reconstitution of ~~surface to air missiles~~ 6 ongoing in Iraq with Operations  
2 ~~SAMs~~. This is done to reduce the threat to 7 SOUTHERN WATCH and NORTHERN  
3 coalition aircraft flying in the NFZ 8 WATCH.  
4 operation. Since Operation DESERT 9  
5 STORM, NFZ enforcement has been

### OPERATIONS SOUTHERN WATCH AND NORTHERN WATCH

10  
11  
12  
13 The Joint Task Force — Southwest Asia (JTF — SWA) is a multi-Service,  
14 multinational coalition. The coalition conducts Operation SOUTHERN WATCH  
15 (OSW) to ensure Iraqi compliance with United Nations resolutions. Operation  
16 NORTHERN WATCH (ONW) is a combined task force (CTF) charged with  
17 enforcing the no-fly zone north of the 36th parallel in Iraq. After the Gulf War in  
18 1991, the UN Security Council resolutions resulted in the establishment of no-fly  
19 zones banning Iraqi flights over northern and southern Iraq after Hussein's  
20 forces attacked Kurds in the north and Shiite Muslims in the south. ONW began  
21 in January 1997 on the heels of Operation PROVIDE COMFORT, the five-year-  
22 long relief effort that delivered food and supplies to Iraq's Kurdish refugees.  
23 ONW is charged with monitoring Iraqi compliance with UN Security Council  
24 resolutions 678, 687, and 688. ~~The northern no-fly zone is not an aggression~~  
25 ~~against Iraq or a violation of its sovereignty, it is a necessary and legitimate~~  
26 ~~measure to limit Iraq's aggressive air activities.~~ OSW began at the conclusion of  
27 Operation DESERT STORM.

## APPENDIX C

### ADMINISTRATIVE INSTRUCTIONS

#### 1. User Comments

Users in the field are highly encouraged to submit comments on this publication to: Commander, United States Joint Forces Command, Joint Warfighting Center Code JW100, 116 Lake View Parkway, Suffolk, VA 23435-2697. These comments should address content (accuracy, usefulness, consistency, and organization), writing, and appearance.

#### 2. Authorship

The lead agent for this publication is the US Air Force. The Joint Staff doctrine sponsor for this publication is the Director for Operational Plans and Joint Force Development (J-7).

#### 3. Supersession

This publication supercedes JP 3-01.4, 25 July 1995, *Joint Tactics, Techniques, and Procedures for Joint Suppression of Enemy Air Defenses (J-SEAD)*.

#### 4. Change Recommendations

a. Recommendations for urgent changes to this publication should be submitted:

TO: HQ AFDC DET 1 LANGLEY AFB VA//CC//  
INFO: JOINT STAFF WASHINGTON DC//J7-JDET//

Routine changes should be submitted to the Director for Operational Plans and Joint Force Development (J-7), JDET, 7000 Joint Staff, Pentagon, Washington, DC 20318-7000, with info copies to the USJFCOM JWFC.

b. When a Joint Staff directorate submits a proposal to the Chairman of the Joint Chiefs of Staff that would change source document information reflected in this publication, that directorate will include a proposed change to this publication as an enclosure to its proposal. The Military Services and other organizations are requested to notify the Director, J-7, Joint Staff, when changes to source documents reflected in this publication are initiated.

c. Record of Changes:

| CHANGE<br>NUMBER | COPY<br>NUMBER | DATE OF<br>CHANGE | DATE<br>ENTERED | POSTED<br>BY | REMARKS |
|------------------|----------------|-------------------|-----------------|--------------|---------|
|                  |                |                   |                 |              |         |
|                  |                |                   |                 |              |         |
|                  |                |                   |                 |              |         |

### 5. Distribution

a. Additional copies of this publication can be obtained through Service publication centers listed below (initial contact) or the USJFCOM JWFC in the event that the joint publication is not available from the Service.

b. Only approved joint publications and joint test publications are releasable outside the combatant commands, Services, and Joint Staff. Release of any classified joint publication to foreign governments or foreign nationals must be requested through the local embassy (Defense Attaché Office) to DIA Foreign Liaison Office, PSS, PO-FL, Room 1A674, Pentagon, Washington, DC 20301-7400.

c. Additional copies should be obtained from the Military Service assigned administrative support responsibility by DOD Directive 5100.3, 15 November 1999, *Support of the Headquarters of Unified, Specified, and Subordinate Joint Commands*.

## PART II — TERMS AND DEFINITIONS

**airspace control authority.** The commander designated to assume overall responsibility for the operation of the airspace control system in the airspace control area. Also called ACA. (JP 1-02)

**airspace control order.** An order implementing the airspace control plan that provides the details of the approved requests for airspace control measures. It is published either as part of the air tasking order or as a separate document. Also called ACO. (JP 1-02)

**airspace control plan.** The document approved by the joint force commander that provides specific planning guidance and procedures for the airspace control system for the joint force area of responsibility and/or joint operations area. Also called ACP. (JP 1-02)

**air superiority.** That degree of dominance in the air battle of one force over another which permits the conduct of operations by the former and its related land, sea and air forces at a given time and place without prohibitive interference by the opposing force. (JP 1-02)

**air supremacy.** That degree of air superiority wherein the opposing air force is incapable of effective interference. (JP 1-02)

**area air defense commander.** Within a unified command, subordinate unified command, or joint task force, the commander will assign overall responsibility for air defense to a single commander. Normally, this will be the component commander with the preponderance of air defense capability

and the command, control, and communications capability to plan and execute integrated air defense operations. Representation from the other components involved will be provided, as appropriate, to the area air defense commander's headquarters. Also called AADC. (JP 1-02)

**centers of gravity.** Those characteristics, capabilities, or ~~localities—sources of~~ power from which a military force derives its freedom of action, physical strength, or will to fight. Also called COGs. (JP1-02)

**combat air patrol.** An aircraft patrol provided over an objective area, the force protected, the critical area of a combat zone, or in an air defense area, for the purpose of intercepting and destroying hostile aircraft before they reach their targets. Also called CAP. (JP 1-02)

**counterair.** A mission ~~which—that~~ integrates offensive and defensive operations to attain and maintain a desired degree of air superiority. Counterair missions are designed to destroy or negate enemy aircraft and missiles, both before and after launch. (JP 1-02)

**defensive counterair.** All defensive measures designed to detect, identify, intercept, and destroy or negate enemy forces attempting to attack or penetrate the friendly air environment. Also called DCA. (JP 1-02)

**direct support.** A mission requiring a force to support another specific force and authorizing it to answer directly to the supported force's request for assistance. Also called DS. (JP 1-02)

## Glossary

**electronic warfare.** Any military action involving the use of electromagnetic and directed energy to control the electromagnetic spectrum or to attack the enemy. Also called EW. The three major subdivisions within electronic warfare are: electronic attack, electronic protection, and electronic warfare support. a. electronic attack. That division of electronic warfare involving the use of electromagnetic, directed energy, or antiradiation weapons to attack personnel, facilities, or equipment with the intent of degrading, neutralizing, or destroying enemy combat capability. Also called EA. EA includes: 1) actions taken to prevent or reduce an enemy's effective use of the electromagnetic spectrum, such as jamming and electromagnetic deception, and 2) employment of weapons that use either electromagnetic or directed energy as their primary destructive mechanism (lasers, radio frequency weapons, particle beams). b. electronic protection. That division of electronic warfare involving actions taken to protect personnel, facilities, and equipment from any effects of friendly or enemy employment of electronic warfare that degrade, neutralize, or destroy friendly combat capability. Also called EP. c. electronic warfare support. That division of electronic warfare involving actions tasked by, or under direct control of, an operational commander to search for, intercept, identify, and locate sources of intentional and unintentional radiated electromagnetic energy for the purpose of immediate threat recognition. Thus, electronic warfare support provides information required for immediate decisions involving electronic warfare operations and other tactical actions such as threat avoidance, targeting, and homing. Also called ES. Electronic

warfare support data can be used to produce signals intelligence, both communications intelligence, and electronics intelligence. (JP 1-02)

**fires.** The effects of lethal or nonlethal weapons. (JP 1-02)

~~**fighter escort.** fighter aircraft that are assigned to protect other aircraft during a mission. (Upon approval of this publication, this term and its definition will be included in JP 1-02.)~~

**fighter sweep.** An offensive mission by fighter aircraft to seek out and destroy ~~enemy-adversary~~ aircraft or airborne targets of opportunity in an allotted area of operations sector. (Upon approval of this revision, this term and its definition will modify the existing term and its definition and will be included in JP 1-02.)

**information operations.** Actions taken to affect adversary information and information systems while defending one's own information and information systems. Also called IO. (JP 1-02)

**intelligence preparation of the battlespace.** An analytical methodology employed to reduce uncertainties concerning the ~~adversary enemy~~, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive ~~data-base-database~~ for each potential area in which a unit may be required to operate. The ~~data-base database~~ is then analyzed in detail to determine the impact of the ~~adversary enemy~~, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. Also called IPB. (Upon approval of this publication, this term and its definition

- ~~will modify the existing term and its definition and will be included in JP 1-02-)~~
- joint force air component commander.** The commander within a unified command, subordinate unified command, or joint task force responsible to the establishing commander for making recommendations on the proper employment of assigned, attached, and/or made available for tasking air forces; planning and coordinating air operations; or accomplishing such operational missions as may be assigned. The joint force air component commander is given the authority necessary to accomplish missions and tasks assigned by the establishing commander. Also called JFACC. ~~(This term and its definition are provided for information and are proposed for inclusion in the next edition of JP 1-02 by JP 3-0.)~~
- joint force commander.** A general term applied to a combatant commander, subunified commander, or joint task force commander authorized to exercise combatant command (command authority) or operational control over a joint force. Also called JFC. (JP 1-02)
- joint intelligence preparation of the battlespace.** The analytical process used by joint intelligence organizations to produce intelligence assessments, estimates, and other intelligence products in support of the joint force commander's decision making process. It is a continuous process that includes defining the total battlespace environment; describing the battlespace's effects; evaluating the adversary; and determining and describing adversary potential courses of action. The process is used to analyze the air, land, sea, space,
- electromagnetic, cyberspace, and human dimensions of the environment and to determine an opponent's capabilities to operate in each. Joint intelligence preparation of the battlespace products are used by the joint force and component staff in preparing their estimates and are also applied during the analysis and election of friendly courses of action. Also called JIPB. (JP 1-02)
- joint suppression of ~~adversary-enemy~~ air defenses.** A broad term that includes all suppression of ~~adversary-enemy~~ air defense activities provided by one component of the joint force in support of another. Also called J-SEAD. ~~(Upon approval of this publication, this term and its definition will modify the existing term and its definition and will be included in JP 1-02-)~~
- joint targeting coordination board.** A group formed by the joint force commander to accomplish broad targeting oversight functions that may include but are not limited to coordinating targeting information, providing targeting guidance and priorities, and preparing and/or refining the joint integrated prioritized target list. The board is normally comprised of representatives from the joint force staff, all components, and if required, component subordinate units. Also called JTCB. (JP 1-02)
- offensive counterair.** Offensive operations to destroy, disrupt, or neutralize ~~adversary-enemy~~ aircraft, missiles, launch platforms, and their supporting structures and systems both before and after launch, but as close to their source as possible. Offensive counterair operations range throughout ~~adversary-enemy~~ territory and are generally conducted at the initiative of

## Glossary

friendly forces. These operations include attack operations, fighter sweep, escort, and suppression of ~~adversary enemy~~ air defenses. Also called OCA. ~~(Upon approval of this publication, this term and its definition will modify the existing term and its definition and will be included in JP 1-02.)~~

### **offensive counterair attack operations.**

Offensive action in support of the offensive counterair mission against surface targets which contribute to the ~~adversary's enemy's~~ air power capabilities. The objective of attack operations is to prevent the hostile use of aircraft and missile forces by attacking targets such as missile launch sites, airfields, naval vessels, command and control nodes, munitions stockpiles, and supporting infrastructure. Attack operations may be performed by fixed- or ~~rotary wing rotary-wing~~ aircraft, surface-to-surface weapons, special operations forces, or ground forces. Also called OCA attack ops. ~~(Upon approval of this publication, this term and its definition will modify the existing term and its definition and will be included in JP 1-02.)~~

**operational control.** Command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in combatant command (command authority) and may be delegated within the command. When forces are transferred between combatant commands, the command relationship the gaining commander will exercise (and the losing commander will relinquish) over these forces must be specified by the Secretary of Defense. Operational control is the authority to perform those functions of command over subordinate forces involving organizing and

employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction necessary to accomplish the mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and Service and/or functional component commanders. Operational control normally provides full authority to organize commands and forces and to employ those forces as the commander in operational control considers necessary to accomplish assigned missions; it does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. Also called OPCON. (JP 1-02)

**positive control.** A method of airspace control which relies on positive identification, tracking, and direction of aircraft within an airspace, conducted with electronic means by an agency having the authority and responsibility therein. (JP 1-02)

**procedural control.** A method of airspace control which relies on a combination of previously agreed and promulgated orders and procedures. (JP 1-02)

**rules of engagement.** Directives issued by competent military authority ~~which~~ that delineate the circumstances and limitations under which United States forces will initiate and/or continue combat engagement with other forces encountered. Also called ROE. (JP 1-02)

**supported commander.** 1. The commander having primary responsibility for all aspects of a task assigned by the Joint Strategic Capabilities Plan or other joint operation planning authority. In the context of joint operation planning, this term refers to the commander who prepares operation plans, or operation orders in response to requirements of the Chairman of the Joint Chiefs of Staff. 2. In the context of a support command relationship, the commander who receives assistance from another commander's force or capabilities, and who is responsible for ensuring that the supporting commander understands the assistance required. (JP 1-02)

**supporting commander.** 1. A commander who provides augmentation forces or other support to a supported commander or who develops a supporting plan. Includes the designated combatant commands and Defense agencies as appropriate. 2. In the context of a support command relationship, the commander who aids, protects, complements, or sustains another commander's force, and who is responsible for providing the assistance required by the supported commander. (JP 1-02)

**suppression of ~~adversary~~ enemy air defenses.** That activity which neutralizes, destroys, or temporarily degrades surface-based ~~adversary~~ enemy air defenses by destructive and/or disruptive means. Also called SEAD. ~~(Upon approval of this publication, this term and its definition will modify the existing term and its definition and will be included in JP 1-02-)~~

**tactical control.** Command authority over assigned or attached forces or commands, or military capability or forces made available for tasking, that is limited to the detailed direction and control of movements or maneuvers within the operational area necessary to accomplish missions or tasks assigned. Tactical control is inherent in operational control. Tactical control may be delegated to, and exercised at any level at or below the level of combatant command. When forces are transferred between combatant commands, the command relationship the gaining commander will exercise (and the losing commander will relinquish) over these forces must be specified by the Secretary of Defense. Tactical control provides sufficient authority for controlling and directing the application of force or tactical use of combat support assets within the assigned mission or task. Also called TACON. (JP 1-02)

**theater missile.** A missile, which may be a ballistic missile, a cruise missile, or an air-to-surface missile (not including short-range, non-nuclear, direct fire missiles, bombs, or rockets such as Maverick or wire-guided missiles), whose target is within a given theater of operation. Also called TM. (JP 1-02)

**time-sensitive targets.** Those targets requiring immediate response because they pose (or will soon pose) a danger to friendly forces or are highly lucrative, fleeting targets of opportunity. Also called TSTs. ~~The JFC normally provides specific guidance and prioritization for TSTs within his or her joint operational area. Also called TSTs. (Upon approval of this~~

# JOINT DOCTRINE PUBLICATIONS HIERARCHY

All joint doctrine and tactics, techniques, and procedures are organized into a comprehensive hierarchy as shown in the chart above. **Joint Publication (JP) 3-01.2** is in the **Operations** series of joint doctrine publications. The diagram below illustrates an overview of the development process:
