

Steps for Class Exercise

1. Download data from the web for National Parks attendance for 5 years 2004-2008.
<http://www.nature.nps.gov/stats/index.cfm>
2. Save the data as a separate worksheet for this analysis.

3. Create a “chart basis” so that you can show a column chart for two selected parks – hard code a row number that will later will linked to a form control that will place the park name and attendance numbers for that park for each year. Create a chart on a “focus” worksheet that will reflect this information.

	0	1	2	3	4	5
	Park	2004	2005	2006	2007	2008
3	Adams NHP	239,504	220,467	225,318	224,880	241,536
8	Andersonvil	165,929	132,466	132,153	153,686	159,592

4. On the chart basis worksheet develop a form control that will allow you to select a particular park. Test this and link to the “hard coded” row value in previous step to ensure its operability.
5. Refine the “focus” worksheet so that it now shows the completed chart with two form controls allowing you to select two parks and show their attendance numbers.
