

Normal Forms

Functional dependencies

Our goal:

given a set of FD set, F, find an alternative FD set, G that is:
smaller
equivalent

Bad news:

Testing $F=G$ ($F^+ = G^+$) is computationally expensive

Good news:

Minimal Cover (or Canonical Cover) algorithm:
given a set of FD, F, finds minimal FD set equivalent to F

Minimal: can't find another equivalent FD set w/ fewer FD's

Minimal Cover Algorithm

Given:

$$F = \{ A \rightarrow BC, \\ B \rightarrow CE, \\ A \rightarrow E, \\ AC \rightarrow H, \\ D \rightarrow B \}$$

Determines minimal cover of F:

$$F_c = \{ A \rightarrow BH, \\ B \rightarrow CE, \\ D \rightarrow B \}$$

- $F_c = F$
- No G that is equivalent to F and is smaller than F_c

Another example:

$$F = \{ A \rightarrow BC, \\ B \rightarrow C, \\ A \rightarrow B, \\ AB \rightarrow C, \\ AC \rightarrow D \}$$

MC
Algorithm

$$F_c = \{ A \rightarrow BD, \\ B \rightarrow C \}$$

Minimal Cover Algorithm

Basic Algorithm

ALGORITHM MinimalCover (X: FD set)

BEGIN

REPEAT UNTIL STABLE

- (1) Where possible, apply UNION rule (A's axioms)
(e.g., $A \rightarrow BC, A \rightarrow CD$ becomes $A \rightarrow BCD$)
- (2) remove "extraneous attributes" from each FD
(e.g., $AB \rightarrow C, A \rightarrow B$ becomes
 $A \rightarrow B, B \rightarrow C$
i.e., A is extraneous in $AB \rightarrow C$)

Extraneous Attributes

- (1) Extraneous is RHS?
e.g.: can we replace $A \rightarrow BC$ with $A \rightarrow C$?
(i.e. Is B extraneous in $A \rightarrow BC$?)
- (2) Extraneous in LHS ?
e.g.: can we replace $AB \rightarrow C$ with $A \rightarrow C$?
(i.e. Is B extraneous in $AB \rightarrow C$?)

Simple but expensive test:

1. Replace $A \rightarrow BC$ (or $AB \rightarrow C$) with $A \rightarrow C$ in F

$$F_2 = F - \{A \rightarrow BC\} \cup \{A \rightarrow C\}$$

or

$$F - \{AB \rightarrow C\} \cup \{A \rightarrow C\}$$

2. Test if $F_2^+ = F^+$?
if yes, then B extraneous

Extraneous Attributes

A. RHS: Is B extraneous in $A \rightarrow BC$?

step 1: $F_2 = F - \{A \rightarrow BC\} \cup \{A \rightarrow C\}$

step 2: $F^+ = F_2^+$?

To simplify step 2, observe that $F_2^+ \subseteq F^+$

i.e., not new FD's in F_2^+)

Why? Have effectively removed $A \rightarrow B$ from F

When is $F^+ = F_2^+$?
Ans. When $(A \rightarrow B)$ in F_2^+

Idea: if F_2^+ includes: $A \rightarrow B$ and $A \rightarrow C$,
then it includes $A \rightarrow BC$

Extraneous Attributes

B. LHS: Is B extraneous in $A \rightarrow C$?

step 1: $F_2 = F - \{A \rightarrow B\} \cup \{A \rightarrow C\}$

step 2: $F^+ = F_2^+$?

To simplify step 2, observe that $F^+ \subseteq F_2^+$

i.e., there may be new FD's in F_2^+)

Why? $A \rightarrow C$ "implies" $A \rightarrow B$. therefore all FD's in F^+ also in F_2^+ .

But $A \rightarrow B$ does not "imply" $A \rightarrow C$

When is $F^+ = F_2^+$?

Ans. When $(A \rightarrow C)$ in F^+ Idea: if F^+ includes: $A \rightarrow C$ then it will include all the FD's of F^+ .

Extraneous attributes

A. RHS :

Given $F = \{A \rightarrow B, B \rightarrow C\}$ is C extraneous in $A \rightarrow BC$?

why or why not?

Ans: yes, because

$A \rightarrow C$ in $\{A \rightarrow B, B \rightarrow C\}^+$

Proof. 1. $A \rightarrow B$
2. $B \rightarrow C$
3. $A \rightarrow C$ transitivity using Armstrong's axioms

Extraneous attributes

B. LHS :

Given $F = \{A \rightarrow B, AB \rightarrow C\}$ is B extraneous in $AB \rightarrow C$?

why or why not?

Ans: yes, because

$A \rightarrow C$ in F^+

Proof. 1. $A \rightarrow B$
2. $AB \rightarrow C$
3. $A \rightarrow C$ using pseudotransitivity on 1 and 2

Actually, we have $AA \rightarrow C$ but $\{A, A\} = \{A\}$

Minimal Cover Algorithm

ALGORITHM MinimalCover (F: set of FD's)

BEGIN

REPEAT UNTIL STABLE

(1) Where possible, apply UNION rule (A's axioms)

(2) Remove all extraneous attributes:

a. Test if B extraneous in $A \rightarrow BC$

(B extraneous if

$(A \rightarrow B)$ in $(F - \{A \rightarrow BC\} \cup \{A \rightarrow C\})^+$)

b. Test if B extraneous in $AB \rightarrow C$

(B extraneous in $AB \rightarrow C$ if

$(A \rightarrow C)$ in F^+)

Minimal Cover Algorithm

Example: determine the minimal cover of
 $F = \{A \rightarrow BC, B \rightarrow CE, A \rightarrow E\}$

Iteration 1:

- a. $F = \{A \rightarrow BCE, B \rightarrow CE\}$
- b. Must check for up to 5 extraneous attributes
 - B extraneous in $A \rightarrow BCE$? No
 - C extraneous in $A \rightarrow BCE$?
yes: $(A \rightarrow C)$ in $\{A \rightarrow BE, B \rightarrow CE\}$
1. $A \rightarrow BE \rightarrow 2. A \rightarrow B \rightarrow 3. A \rightarrow CE \rightarrow 4. A \rightarrow C$
 - E extraneous in $A \rightarrow BE$?

Minimal Cover Algorithm

Example: determine the minimal cover of
 $F = \{A \rightarrow BC, B \rightarrow CE, A \rightarrow E\}$

Iteration 1:

- a. $F = \{A \rightarrow BCE, B \rightarrow CE\}$
- b. Must check for up to 5 extraneous attributes
 - B extraneous in $A \rightarrow BCE$? No
 - C extraneous in $A \rightarrow BCE$? Yes
 - E extraneous in $A \rightarrow BE$?
1. $A \rightarrow B \rightarrow 2. A \rightarrow CE \rightarrow A \rightarrow E$
 - E extraneous in $B \rightarrow CE$ No
 - C extraneous in $B \rightarrow CE$ No

Iteration 2:

- a. $F = \{A \rightarrow B, B \rightarrow CE\}$
- b. Extraneous attributes:
 - C extraneous in $B \rightarrow CE$ No
 - E extraneous in $B \rightarrow CE$ No

DONE

Minimal Cover Algorithm

Find the minimal cover of

$$F = \{ A \rightarrow BC, \\ B \rightarrow CE, \\ A \rightarrow E, \\ AC \rightarrow H, \\ D \rightarrow B \}$$

$$\text{Ans: } F_c = \{ A \rightarrow BH, B \rightarrow CE, D \rightarrow B \}$$

Minimal Cover Algorithm

Find two different minimal covers of:

$$F = \{ A \rightarrow BC, B \rightarrow CA, C \rightarrow AB \}$$

Ans:

$$F_{c1} = \{ A \rightarrow B, B \rightarrow C, C \rightarrow A \}$$

and

$$F_{c2} = \{ A \rightarrow C, B \rightarrow A, C \rightarrow B \}$$

FD so far...

1. Minimal Cover algorithm
 - result (Fc) guaranteed to be the minimal FD set equivalent to F

2. Closure Algorithms
 - a. Armstrong's Axioms:
 - more common use: test for extraneous attributes in C.C. algorithm
 - b. Attribute closure:
 - more common use: test for superkeys

3. Purposes
 - a. minimize the cost of global integrity constraints
 - so far: min gic's = |Fc|

 - In fact.... Min gic's = 0
(FD's for "normalization")

Another use of FD's: Schema Design

Example:

R =

bname	bcity	assets	cname	lno	amt
Downtown	Bkln	9M	Jones	L-17	1000
Downtown	Bkln	9M	Johnson	L-23	2000
Mianus	Horse	1.7M	Jones	L-93	500
Downtown	Bkln	9M	Hayes	L-17	1000

R: "Universal relation"

tuple meaning: Jones has a loan (L-17) for \$1000 taken out at the Downtown branch in Bkln which has assets of \$9M

Design:

- + : fast queries (no need for joins!)
- : redundancy:
 - update anomalies examples?
 - deletion anomalies

Decomposition

1. Decomposing the schema

$R = (bname, bcity, assets, cname, lno, amt)$

$R = R1 \cup R2$

$R1 = (bname, bcity, assets, cname)$ $R1 = (cname, lno, amt)$

2. Decomposing the instance

bname	bcity	assets	cname	lno	amt
Downtown	Bkln	9M	Jones	L-17	1000
Downtown	Bkln	9M	Johnson	L-23	2000
Mianus	Horse	1.7M	Jones	L-93	500
Downtown	Bkln	9M	Hayes	L-17	1000

bname	bcity	assets	cname
Downtown	Bkln	9M	Jones
Downtown	Bkln	9M	Johnson
Mianus	Horse	1.7M	Jones
Downtown	Bkln	9M	Hayes

cname	lno	amt
Jones	L-17	1000
Johnson	L-23	2000
Jones	L-93	500
Hayes	L-17	1000

Goals of Decomposition

1. Lossless Joins

Want to be able to reconstruct big (e.g. universal) relation by joining smaller ones (using natural joins)

(i.e. $R1 \bowtie R2 = R$)

2. Dependency preservation

Want to minimize the cost of global integrity constraints based on FD's (i.e. avoid big joins in assertions)

3. Redundancy Avoidance

Avoid unnecessary data duplication (the motivation for decomposition)

Why important?

LJ : information loss

DP: efficiency (time)

RA: efficiency (space), update anomalies

Dependency Goal #1: lossless joins

A bad decomposition:

bname	bcity	assets	cname
Downtown	Bkln	9M	Jones
Downtown	Bkln	9M	Johnson
Mianus	Horse	1.7M	Jones
Downtown	Bkln	9M	Hayes

cname	lno	amt
Jones	L-17	1000
Johnson	L-23	2000
Jones	L-93	500
Hayes	L-17	1000

=

bname	bcity	assets	cname	lno	amt
Downtown	Bkln	9M	Jones	L-17	1000
→ Downtown	Bkln	9M	Jones	L-93	500
→ Downtown	Bkln	9M	Johnson	L-23	2000
Mianus	Horse	1.7M	Jones	L-17	1000
Mianus	Horse	1.7M	Jones	L-93	500
Downtown	Bkln	9M	Hayes	L-17	1000

Problem: join adds meaningless tuples

"lossy join": by adding noise, have lost meaningful information as a result of the decomposition

Dependency Goal #1: lossless joins

Is the following decomposition lossless or lossy?

bname	assets	cname	lno
Downtown	9M	Jones	L-17
Downtown	9M	Johnson	L-23
Mianus	1.7M	Jones	L-93
Downtown	9M	Hayes	L-17

lno	bcity	amt
L-17	Bkln	1000
L-23	Bkln	2000
L-93	Horse	500

Ans: Lossless: $R = R1 \bowtie R2$, it has 4 tuples

Ensuring Lossless Joins

A decomposition of R : $R = R1 \cup R2$ is lossless iff

$R1 \cap R2 \rightarrow R1$, or

$R1 \cap R2 \rightarrow R2$

(i.e., intersecting attributes must be a superkey for one of the resulting smaller relations)

Decomposition Goal #2: Dependency preservation

Goal: efficient integrity checks of FD's

An example w/ no DP:

$R = (\text{bname}, \text{bcity}, \text{assets}, \text{cname}, \text{lno}, \text{amt})$

$\text{bname} \rightarrow \text{bcity assets}$

$\text{lno} \rightarrow \text{amt bname}$

Decomposition: $R = R1 \cup R2$

$R1 = (\text{bname}, \text{assets}, \text{cname}, \text{lno})$

$R2 = (\text{lno}, \text{bcity}, \text{amt})$

Lossless but not DP. Why?

Ans: $\text{bname} \rightarrow \text{bcity assets}$ crosses 2 tables

Decomposition Goal #2: Dependency preservation

To ensure best possible efficiency of FD checks

ensure that only a SINGLE table is needed in order to check each FD

i.e. ensure that: $A_1 A_2 \dots A_n \rightarrow B_1 B_2 \dots B_m$

Can be checked by examining $R_i = (\dots, A_1, A_2, \dots, A_n, \dots, B_1, \dots, B_m, \dots)$

To test if the decomposition $R = R_1 \cup R_2 \cup \dots \cup R_n$ is DP

(1) see which FD's of R are covered by R_1, R_2, \dots, R_n

(2) compare the closure of (1) with the closure of FD's of R

Decomposition Goal #2: Dependency preservation

Example: Given $F = \{ A \rightarrow B, AB \rightarrow D, C \rightarrow D \}$

consider $R = R_1 \cup R_2$ s.t.

$R_1 = (A, B, C)$, $R_2 = (C, D)$ is it DP?

(1) $F^+ = \{ A \rightarrow BD, C \rightarrow D \}^+$

(2) $G^+ = \{ A \rightarrow B, C \rightarrow D \}^+$

(3) $F^+ = G^+$? No because $(A \rightarrow D)$ not in G^+

Decomposition is not DP

Decomposition Goal #2: Dependency preservation

Example: Given $F = \{A \rightarrow B, AB \rightarrow D, C \rightarrow D\}$

consider $R = R1 \cup R2$ s.t.

$R1 = (A, B, D)$, $R2 = (C, D)$

(1) $F^+ = \{A \rightarrow BD, C \rightarrow D\}^+$

(2) $G^+ = \{A \rightarrow BD, C \rightarrow D, \dots\}^+$

(3) $F^+ = G^+$

note: G^+ cannot introduce new FDs not in F^+

Decomposition is DP

Decomposition Goal #3: Redudancy Avoidance

Example:

A	B	C
a	x	1
e	x	1
g	y	2
h	y	2
m	y	2
n	z	1
p	z	1

Redundancy
for $B=x, y$ and z

(1) An FD that exists in the above relation is: $B \rightarrow C$

(2) A superkey in the above relation is A, (or any set containing A)

When do you have redundancy?

Ans: when there is some FD, $X \rightarrow Y$ covered by a relation
and X is not a superkey

Normalization

Decomposition techniques for ensuring:

Lossless joins

Dependency preservation

Redundancy avoidance

We will look at some normal forms:

Boyce-Codd Normal Form (BCNF)

3rd Normal Form (3NF)

Boyce-Codd Normal Form (BCNF)

What is a normal form?

Characterization of schema decomposition
in terms of properties it satisfies

BCNF: guarantees no redundancy

Defined:

relation schema R , with FD set, F is in BCNF if:

For all nontrivial $X \rightarrow Y$ in F^+ :

$X \rightarrow R$ (i.e. X a superkey)

BCNF

Example: $R=(A, B, C)$
 $F = (A \rightarrow B, B \rightarrow C)$

Is R in BCNF?

Ans: Consider the non-trivial dependencies in F+:

$A \rightarrow B,$	$A \rightarrow R$ (A a key)
$A \rightarrow C,$	-//-
$B \rightarrow C,$	$B \dashrightarrow R$ (B not a superkey)

Therefore not in BCNF

BCNF

Example:
 $R = R1 \cup R2$
 $R1 = (A, B)$, $R2 = (B, C)$
 $F = (A \rightarrow B, B \rightarrow C)$

Are R1, R2 in BCNF?

Ans: Yes, both non-trivial FDs define a key in R1, R2

Is the decomposition lossless? DP?

Ans: Losless: Yes. DP: Yes.

BCNF

Decomposition Algorithm

Algorithm BCNF(R: relation, F: FD set)

Begin

1. Compute F^+
 2. Result $\rightarrow \{R\}$
 3. While some R_i in Result not in BCNF Do
 - a. Chose $(X \rightarrow Y)$ in F^+ s.t.
 $(X \rightarrow Y)$ covered by R_i
 $X \not\rightarrow R_i$ (X not a superkey for R_i)
 - b. Decompose R_i on $(X \rightarrow Y)$
 $R_{i1} \leftarrow X \cup Y$
 $R_{i2} \leftarrow R_i - Y$
 - c. Result \leftarrow Result - $\{R_i\}$ $\cup \{R_{i1}, R_{i2}\}$
 4. return Result
- End

BCNF Decomposition

Example:

$R = (A, B, C, D)$
 $F = (A \rightarrow B, AB \rightarrow D, B \rightarrow C)$

Decompose R into BCNF

Ans: $F_c = \{A \rightarrow BD, B \rightarrow C\}$
 $R = (A, B, C, D)$
 $B \rightarrow C$ is covered by R and B not a superkey

$R_1 = (B, C)$
In BCNF:
 $B \rightarrow C$ and B key

$R_2 = (A, B, D)$
In BCNF: $A \rightarrow B, A \rightarrow D, A \rightarrow BD$
and A is a key

BCNF Decomposition

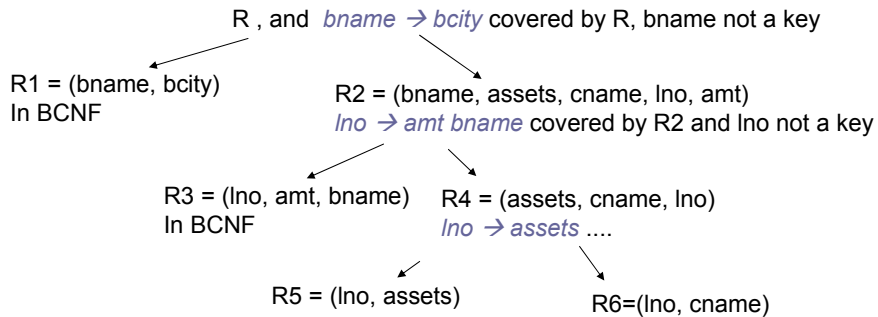

Example:

$R = (\text{bname}, \text{bcity}, \text{assets}, \text{cname}, \text{Ino}, \text{amt})$

$F = \{ \text{bname} \rightarrow \text{bcity assets}, \text{Ino} \rightarrow \text{amt bname} \}$

key= superkey here

Decompose R into BCNF Ans: $F_c = F$

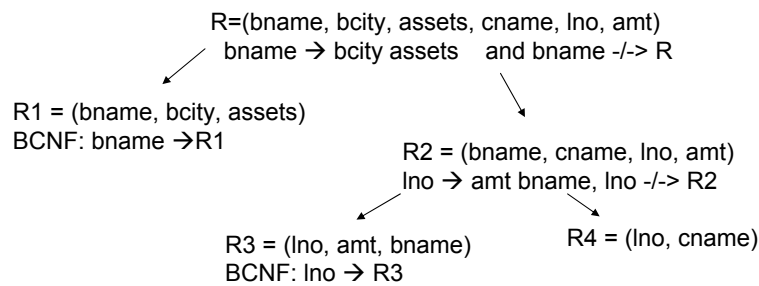

Not DP! $\text{bname} \rightarrow \text{assets}$ is not covered by any relation AND cannot be implied by the covered FDs. Covered FDs: $G = \{ \text{bname} \rightarrow \text{bcity}, \text{Ino} \rightarrow \text{amt bname}, \text{Ino} \rightarrow \text{assets} \}$

BCNF Decomposition

Can there be > 1 BCNF decompositions?

Ans: Yes, last example was not DP. But...

Given $F_c = \{ \text{bname} \rightarrow \text{bcity assets}, \text{Ino} \rightarrow \text{amt bname} \}$

Is $R = R1 \cup R3 \cup R4$ DP? → Yes!!

BCNF Decomposition

Can we decompose on FD's in F_c to get a DP, BCNF decomposition?

Usually, yes, but ...

Consider: $R = (J, K, L)$
 $F = (JK \rightarrow L, L \rightarrow K)$ ($F_c = F$)

We can apply decomposition either using: $JK \rightarrow L$, $L \rightarrow K$ or the opposite

Dec. #1

Dec. #2

Using $L \rightarrow K$

Using $JK \rightarrow L$

$R_1 = (L, K)$

$R_2 = (J, L)$ Not DP.

$R_1 = (J, K, L)$ not BCNF

$R_2 = (J, K)$

So, BCNF and DP decomposition may not be possible.

Aside

Is the example realistic?

Consider: $\text{BankerName} \rightarrow \text{BranchName}$

$\text{BranchName CustomerName} \rightarrow \text{BankerName}$

3NF: An alternative to BCNF

Motivation:

sometimes, BCNF is not what you want

E.g.: street city \rightarrow zip and zip \rightarrow city

BCNF: R1 = { zip, city} R2 = { zip, street}

No redundancy, but to preserve 1st FD requires assertion with join

Alternative: 3rd Normal Form

Designed to say that decomposition can stop at {street, city, zip}

3NF: An alternative to BCNF

BCNF test: Given R with FD set, F: For any non-trivial FD,
 $X \rightarrow Y$ in F^+ and covered by R, then $X \rightarrow R$

3NF test: Given R with FD set, F:

For any non-trivial FD,

$X \rightarrow Y$ in F^+ and covered by R, then

$X \rightarrow R$ or

Y is a subset of some candidate key of R

Thus, 3NF a weaker normal form than BCNF:

i.e. R in BCNF \Rightarrow R in 3NF

but R in 3NF $\not\Rightarrow$ R in BCNF (not sure than R is in BCNF)

3NF: An alternative to BCNF

Example:

$R=(J, K, L)$ $F = \{JK \rightarrow L, L \rightarrow K\}$

then R is 3NF!

Key for R: JK

$JK \rightarrow L$ covered by R, $JK \rightarrow R$

$L \rightarrow K$, K is a part of a candidate key

3NF

Example:

$R=(\text{bname}, \text{cname}, \text{Ino}, \text{amt})$

$F=F_c = \{ \text{Ino} \rightarrow \text{amt bname},$
 $\text{cname bname} \rightarrow \text{Ino} \}$

Q: is R in BCNF, 3NF or neither?

Ans:

R not in BCNF: $\text{Ino} \rightarrow \text{amt}$, covered by R and $\text{Ino} \not\rightarrow R$

R not in 3NF: candidate keys of R: Ino cname
or
cname bname

$\text{Ino} \rightarrow \text{amt bname}$ covered by R

$\{\text{amt bname}\}$ not a subset of a candidate key

3NF

Example: $R = R1 \cup R2$
 $R1 = (\text{Ino}, \text{amt}, \text{bname})$
 $R2 = (\text{Ino}, \text{cname}, \text{bname}), \quad F = F_c = \{ \text{Ino} \rightarrow \text{amt bname},$
 $\text{cname bname} \rightarrow \text{Ino} \}$

Q: Are $R1, R2$ in BCNF, 3NF or neither?

Ans: $R1$ in BCNF : $\text{Ino} \rightarrow \text{amt bname}$ covered by $R1$ and $\text{Ino} \rightarrow R1$

$R2$ not in BCNF: $\text{Ino} \rightarrow \text{bname}$ and $\text{Ino} \not\rightarrow R2$

$R1$ in 3NF (since it is in BCNF)

$R2$ in 3NF: $R2$'s candidate keys: cname bname and Ino cname

$\text{Ino} \rightarrow \text{bname}$, bname subset of a c.key
 $\text{cname bname} \rightarrow \text{Ino}$, Ino subset of a c. key

3NF Decomposition Algorithm

Algorithm 3NF (R : relation, F : FD set)

1. Compute F_c
2. $i \leftarrow 0$
3. For each $X \rightarrow Y$ in F_c do
 if no R_j ($1 \leq j \leq i$) contains X, Y
 $i \leftarrow i+1$
 $R_i \leftarrow X \cup Y$
4. If no R_j ($1 \leq j \leq i$) contains a candidate key for R
 $i \leftarrow i+1$
 $R_i \leftarrow$ any candidate key for R
5. return (R_1, R_2, \dots, R_i)

3NF Decomposition Example

Example:

$R = (bname, cname, banker, office)$

$F_c = \{ banker \rightarrow bname\ office, \\ cname\ bname \rightarrow banker \}$

Q1: candidate keys of R: $cname\ bname$ or $cname\ banker$

Q2: decompose R into 3NF.

Ans: R is not in 3NF: $banker \rightarrow bname\ office$
 $\{bname, office\}$ not a subset of a c. key

3NF: $R_1 = (banker, bname, office)$
 $R_2 = (cname, bname, banker)$
 $R_3 = ?$ Empty (done)

Theory and practice

Performance tuning:

Redundancy not the sole guide to decomposition

Workload matters too!!

- nature of queries run
- mix of updates, queries
-

Workload can influence:

BCNF vs 3NF

may further decompose a BCNF into (4NF)

may denormalize (i.e., undo a decomposition or add new columns)
