# DIGITAL, ANALOGIC

Telemed e eSaúde 11/12 - Intro Comm Nets - pbrandao

## Analogic → Digital

The diagram illustrates the process of converting an analog signal into a digital signal. It consists of two vertically aligned graphs sharing a common horizontal time axis labeled 't'.

The top graph shows a smooth, continuous gray sine wave representing an analog signal. Vertical dashed lines indicate the sampling points. Red arrows point upwards from the horizontal axis to the peaks of the sine wave at each sampling interval, labeled 'Sampling'.

The bottom graph shows the same gray sine wave, but with a red step function overlaid. The step function's height at each time interval corresponds to the amplitude of the sine wave at that interval, representing the digital signal after quantification. This process is labeled 'Quantification'.

## A few words on audio compression

- ❑ Audio signal sampling at a fixed rate:
    - telephone: 8,000 samples/sec
    - CD: 44,100 samples/sec
  - ❑ Each sample is quantized, rounded:
    - Ex.:  $2^8=256$  possible values
  - ❑ Each quantized value is represented by bits
    - 8 bits for 256 values
  - ❑ example: 8,000 samples/sec, 256 quantized values → 64,000 bps
  - ❑ receiver converts bits back to analog signal:
    - some quality reduction
- Example rates
- ❑ CD: 1.411 Mbps
  - ❑ MP3: 96, 128, 160 kbps
  - ❑ Internet telephony: 5.3 kbps and up

## A few words on video compression

- ❑ video: sequence of images displayed at constant rate
    - e.g. 24 images/sec
  - ❑ digital image: array of pixels
    - each pixel represented by bits
  - ❑ redundancy
    - spatial (within image)
    - temporal (from one image to next)
- Examples:
- ❑ MPEG 1 (CD-ROM) 1.5 Mbps
  - ❑ MPEG2 (DVD) 3-6 Mbps
  - ❑ MPEG4 (often used in Internet, < 1 Mbps)
- Research:
- ❑ layered (scalable) video
    - adapt layers to available bandwidth

# INTRODUCTION

## Introduction

### Our goal:

- ❑ get “feel” and terminology
- ❑ more depth, detail *later* in course
- ❑ approach:
  - use Internet as example

### Overview:

- ❑ what’s the Internet?
- ❑ what’s a protocol?
- ❑ network edge; hosts, access net, physical media
- ❑ network core: packet/circuit switching, Internet structure
- ❑ performance: loss, delay, throughput
- ❑ protocol layers, service models

# Summary

## 1.1 What is the Internet?

### 1.2 Network edge

- end systems, access networks, links

### 1.3 Network core

- circuit switching, packet switching, network structure

### 1.4 Delay, loss and throughput in packet-switched networks

### 1.5 Protocol layers, service models

# What's the Internet: under the "hood"

PC

server

Wireless laptop

Cellular phone

Access points

Wired links

router

- millions of connected computing devices: *hosts* = *end systems*

- running *network apps*

- *communication links*

- ❖ fiber, copper, radio, satellite

- ❖ transmission rate = *bandwidth*

- *routers*: forward packets (chunks of data)

Mobile Network

Global ISP

Home Network

Regional ISP

Institutional Network

## What's the Internet: under the "hood"

- ❑ **protocols** control sending, receiving of msgs
  - e.g., TCP, IP, HTTP, Skype, Ethernet
- ❑ **Internet: "network of networks"**
  - loosely hierarchical
  - public Internet versus private intranet
- ❑ **Internet standards**
  - RFC: Request for comments
  - IETF: Internet Engineering Task Force

## What's the Internet: a service view

- ❑ **communication infrastructure** enables distributed applications:
  - Web, VoIP, email, games, e-commerce, file sharing, **telemedicine**
- ❑ **communication services provided to apps:**
  - reliable data delivery from source to destination
  - "best effort" (unreliable) data delivery

# What's a protocol?

## human protocols:

- ❑ "what's the time?"
- ❑ "I have a question"
- ❑ introductions

... specific messages sent  
 ... specific actions taken when messages received, or other events

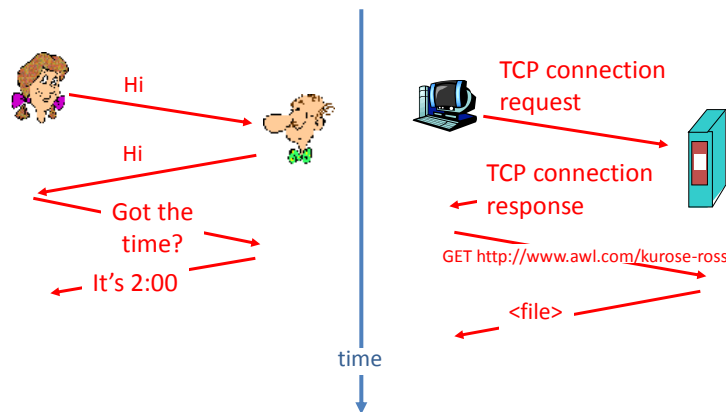

## network protocols:

- ❑ machines rather than humans
- ❑ all communication activity in Internet governed by protocols

*protocols define format, order of messages sent and received among network entities, and actions taken on messages transmission, receipt*

# What's a protocol?

a human protocol and a computer network protocol:

## Summary

### 1.1 What is the Internet?

### 1.2 Network edge

- end systems, access networks, links

### 1.3 Network core

- circuit switching, packet switching, network structure

### 1.4 Delay, loss and throughput in packet-switched networks

### 1.5 Protocol layers, service models

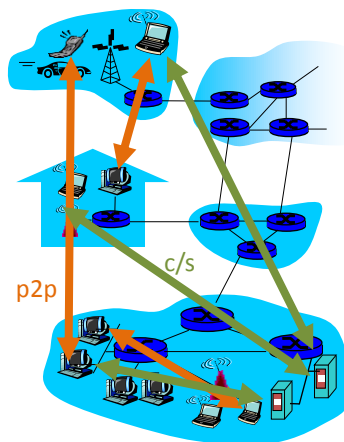

## A closer look at network structure:

- **network edge:**  
applications and hosts
- **access networks,**  
**physical media:** wired,  
wireless communication  
links
- **network core:**
  - interconnected routers
  - network of networks

## The network edge:

- ❑ **end systems (hosts):**
  - run application programs
  - e.g. Web, email
  - at “edge of network”
- ❑ **client/server model**
  - client host requests, receives service from always-on server
  - e.g. Web browser/server; email client/server
- ❑ **peer-peer model:**
  - minimal (or no) use of dedicated servers
  - e.g. Skype, BitTorrent

## Access networks and physical media

*Q: How to connect end systems to edge router?*

- ❑ residential access nets
- ❑ institutional access networks (school, company)
- ❑ mobile access networks

*Keep in mind:*

- ❑ bandwidth (bits per second) of access network?
- ❑ shared or dedicated?

## Residential access: point to point

### ❑ Modem connection

- Uses existing telephony infrastructure
  - Home is connected to **central office**
- up to 56Kbps direct access to router (often less)
- Can't surf and phone at same time: not **"always on"**

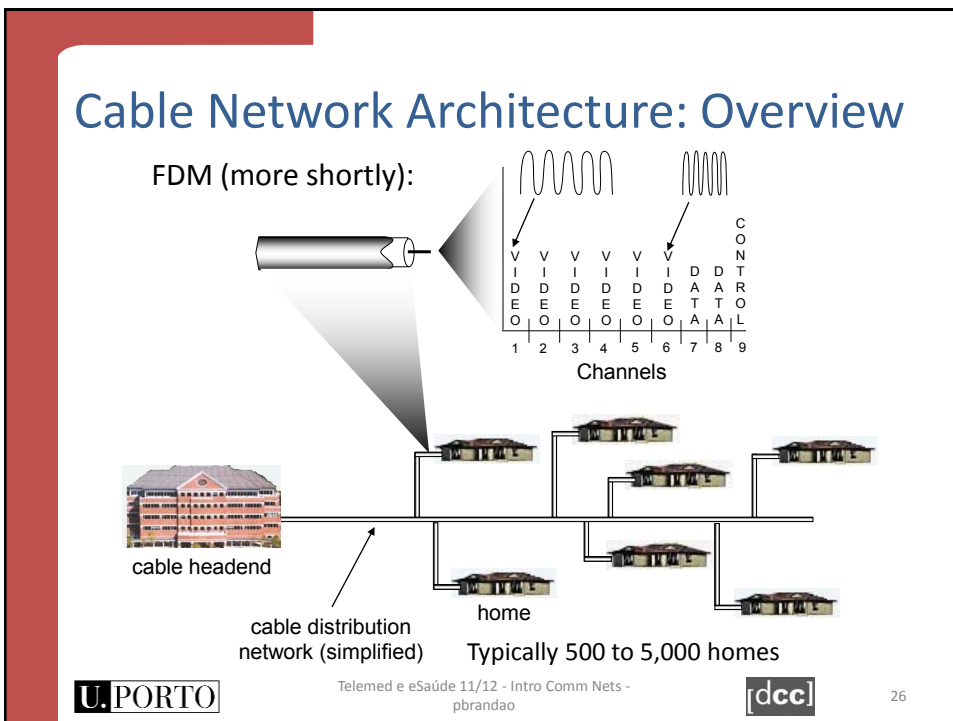

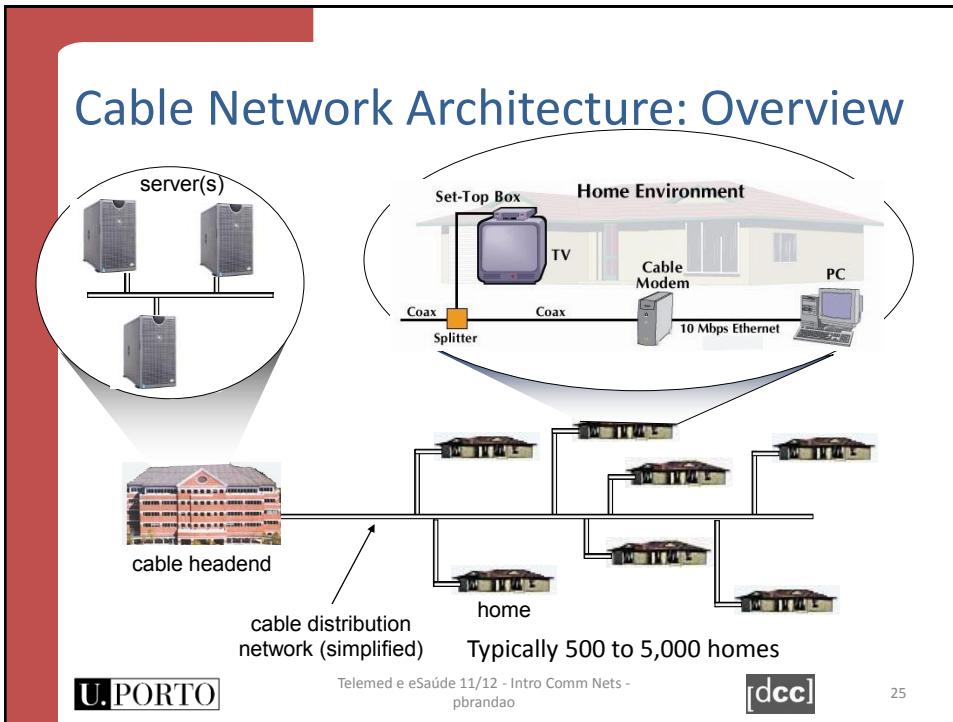

### ❑ DSL: Digital Subscriber Line

- Also uses existing telephone infrastructure
- up to 1 Mbps upstream (today typically < 256 kbps)
- up to 8 Mbps downstream (today typically < 1 Mbps)
- dedicated physical line to telephone central office

## Residential access: cable modems

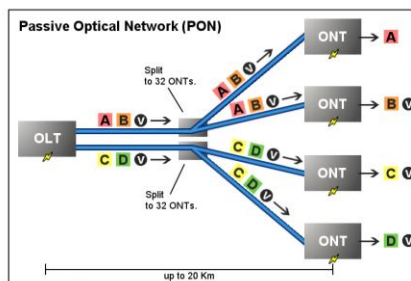

### ❑ HFC: hybrid fibre coaxial

- asymmetric: up to 30Mbps downstream, 2 Mbps upstream
- **network** of cable and fibre attaches homes to ISP router
- homes **share access** to router
  - unlike DSL, which has **dedicated access**
- Usually supplied by cable TV companies

## Cable Network Architecture: fibre optics

- ❑ Active (AON) or passive (PON)
- ❑ Commercial offers from tenths of Mbps up to 1Gbps

Key: A - Data or voice for a single customer. V - Video for multiple customers.

Source: Images from Wikipedia

Telem e eSaúde 11/12 - Intro Comm Nets - pbrandao

27

## Local Area Networks

- ❑ local area network (LAN) connects terminals to routers

❑ Ex.: Ethernet:

- 10 Mbps, 100Mbps, 1Gbps, 10Gbps
- Usual configuration: terminals connect to Ethernet switch

Telem e eSaúde 11/12 - Intro Comm Nets - pbrandao

28

## Wireless access networks

- ❑ shared *wireless* access network connects end system to router
  - via base station aka “access point”
- ❑ **wireless LANs:**
  - 802.11b/g (WiFi): 11 or 54 Mbps
  - 802.11n: upto 600 Mbps
- ❑ **wider-area wireless access**
  - provided by telecommunication operator
  - ~1Mbps over cellular system (EVDO, HSDPA)
  - next up: WiMAX (10’s Mbps) over wide area

## Home Networks

### Typical home network components:

- ❑ DSL or cable modem
- ❑ router/firewall/NAT
- ❑ Ethernet
- ❑ Wireless access point

## Physical Media

- ❑ **Bit:** propagates between transmitter/rcvr pairs
- ❑ **physical link:** what lies between transmitter & receiver
- ❑ **guided media:**
  - signals propagate in solid media: copper, fiber, coax
- ❑ **unguided media:**
  - signals propagate freely, e.g., radio

### Twisted Pair (TP)

- ❑ two insulated copper wires
  - Category 3: traditional phone wires, 10 Mbps Ethernet
  - Category 5: 100Mbps Ethernet

## Physical Media: coax, fiber

### Coaxial cable:

- ❑ two concentric copper conductors
- ❑ bidirectional
- ❑ baseband:
  - single channel on cable
  - legacy Ethernet
- ❑ broadband:
  - multiple channels on cable
  - HFC

### Fiber optic cable:

- ❑ glass fiber carrying light pulses, each pulse a bit
- ❑ high-speed operation:
  - ✦ high-speed point-to-point transmission (e.g., 10's-100's Gps)
- ❑ low error rate: repeaters spaced far apart ; immune to electromagnetic noise

## Physical media: radio

- ❑ signal carried in electromagnetic spectrum
- ❑ no physical “wire”
- ❑ bidirectional
- ❑ propagation environment effects:
  - reflection
  - obstruction by objects
  - interference

### Radio link types:

- ❑ **terrestrial microwave**
  - e.g. up to 45 Mbps channels
- ❑ **LAN (e.g., Wifi)**
  - 11Mbps, 54 Mbps
- ❑ **wide-area (e.g., cellular)**
  - 3G cellular: ~ 1 Mbps
- ❑ **Satellite**
  - Kbps to 45Mbps channel (or multiple smaller channels)
  - 270 msec end-end delay
  - geosynchronous versus low altitude

## Summary

### 1.1 What is the Internet?

### 1.2 Network edge

- ❑ end systems, access networks, links

### 1.3 Network core

- ❑ circuit switching, packet switching, network structure

### 1.4 Delay, loss and throughput in packet-switched networks

### 1.5 Protocol layers, service models

## The Network Core

- ❑ mesh of interconnected routers
- ❑ **the fundamental question:** how is data transferred through net?
  - **circuit switching:** dedicated circuit per call: telephone net
  - **packet-switching:** data sent thru net in discrete "chunks"

## Network Core: Circuit Switching

**End-end resources reserved for "call"**

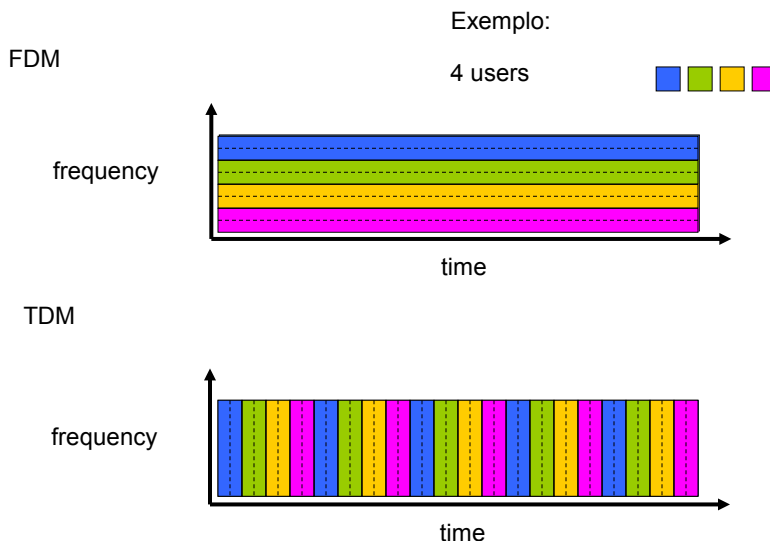

- ❑ link bandwidth, switch capacity
- ❑ dedicated resources: no sharing
- ❑ circuit-like (guaranteed) performance
- ❑ call setup required
  - Establishing connection
  - Data transfer
  - disconnecting

## Network Core: Circuit Switching

- ❑ Developed to transmit voice
- ❑ “Intelligence” resides on the network
- ❑ Dedicated resources per call
  - No sharing (capacity wasted)
  - **Guaranteed performance**
- ❑ Good resource usage for voice calls
  - Someone is always talking most of the time...
- ❑ For data
  - Inactive line most of the time
- ❑ Dividing link bandwidth into “pieces”
  - Frequency division (FDM)
  - Time division (TDM)

## Circuit Switching: FDM and TDM

## Numerical example

□ How long does it take to send a file of 640,000 bits from host A to host B over a circuit-switched network?

- All links are 1,536 Mbps
- Each link uses TDM with 24 slots/s
- 500 ms to establish end-to-end circuit

$$\frac{1536Mbps}{24} = 64kbps \qquad \frac{640000bits}{64kbps} = 10s$$

$$10s + 500ms = \mathbf{10,5s}$$

\* In practice we need to add propagation delay... More on that later

## Network core: packet switching

## Network Core: Packet Switching

idea: divide end-to-end data flow de in small pieces (packets)

- ❑ Packets o different users share network resources
- ❑ each packet uses full link bandwidth
- ❑ resources used *as needed*

resource contention:

- ❑ aggregate resource demand can exceed amount available
- ❑ congestion: packets queue, wait for link use
- ❑ store and forward: packets move one hop at a time
  - Node receives complete packet before forwarding

Bandwidth division into "pieces"

Dedicated allocation

Resource reservation

## Network core: packet switching

Figure 1.3 Packet Switching: Datagram Approach

Each packet is dealt with independently:

- ❑ No relation with preceding packets
- ❑ Each node chooses next hop per packet
- ❑ Packets for the same destination do not necessarily follow the same route (although they usually do)
- ❑ Packets may arrive out of order
  - ❑ Destination re-orders them
- ❑ Packets may be dropped or corrupted in transit
- ❑ Source and destination are responsible for dealing with losses and corruption

## Packet Switching: Statistical Multiplexing

Sequence of A & B packets does not have fixed pattern, bandwidth shared on demand → **statistical multiplexing**.

In TDM: each host gets same slot in revolving TDM frame.

## Packet-switching: store-and-forward

- ❑ takes  $L/R$  seconds to transmit (push out) packet of  $L$  bits on to link at  $R$  bps
- ❑ **store and forward**: entire packet must arrive at router before it can be transmitted on next link
- ❑ delay =  $3L/R$  (assuming zero propagation delay)

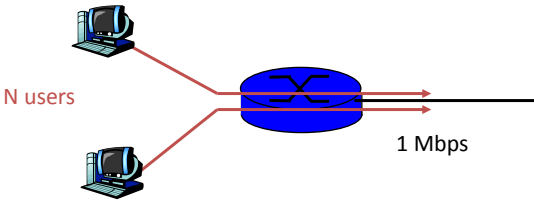

### Example:

- ❑  $L = 7.5$  Mbits
- ❑  $R = 1.5$  Mbps
- ❑ Transmission delay = 15 sec

## Packet switching versus circuit switching

*Packet switching allows more users to use network!*

- ❑ 1 Mb/s link
- ❑ Each user:
  - 100 kb/s when “active”
  - active 10% of time
- ❑ *circuit switching:*
  - 10 users
- ❑ *packet switching :*
  - With 35 users, probability > 10 active at same time is less than 0.0004

The diagram illustrates a network configuration where 'N users' (represented by computer icons) are connected to a central switch (represented by a blue circle with an 'X'). The switch is then connected to a single output link labeled '1 Mbps'.

45

## Packets vs. Circuits

*Is packet switching a “slam dunk winner?”*

|   |   |
|---|---|
| <ul style="list-style-type: none"> <li>❑ Great for bursty data                     <ul style="list-style-type: none"> <li>○ resource sharing</li> <li>○ simpler, no call setup</li> </ul> </li> </ul> | <ul style="list-style-type: none"> <li>❑ <b>excessive congestion:</b> packet delay and loss                     <ul style="list-style-type: none"> <li>○ protocols needed for reliable data transfer, congestion control</li> </ul> </li> </ul> |
|---|---|

**Q: How to provide circuit-like behavior?**

- bandwidth guarantees needed for audio/video apps
- still an unsolved problem

46

## Internet: network of networks

Internet is composed of

- ❑ *Backbones*: infrastructures to interlink networks, like NSFNET, in the USA, GÉANT in Europe, as well as commercial operators *backbones* like PT
- ❑ Regional networks, connecting for example universities and research institutes, e.g. FCCN
- ❑ Commercial networks, e.g. internal usage or for supplying services to customers, like internet connections, e.g. PT, CLIX, ZON, VODAFONE...
- ❑ Local networks

## RCTS (Rede Ciência, Tecnologia e Sociedade)

- ❑ Education and research national network
- ❑ Communication platform to provide researchers, professors and students the specific network resources needed

# GÉANT

- ❑ Pan-European network of research and education
- ❑ Interconnects RCTS and its 30 European counterparts
- ❑ Core at 10Gbps, connections starting at 155Mbps

# Internet: network of networks

- ❑ A packet flow crosses several networks

## Summary

### 1.1 What is the Internet?

### 1.2 Network edge

- end systems, access networks, links

### 1.3 Network core

- circuit switching, packet switching, network structure

### 1.4 Delay, loss and throughput in packet-switched networks

### 1.5 Protocol layers, service models

## How do losses and delays occur?

### Packets queue in router buffers

- packet arrival rate to link exceeds output link capacity
- packets queue, wait for turn

## Four sources of packet delay

### 1. Node processing :

- Check bit errors
- Determine output link

### 2. Queuing

- time waiting at output link for transmission
- depends on congestion level of router

## Four sources of packet delay

### 3. Transmission delay

- $R$  = link bandwidth (bps) (*rate*)
- $L$  = packet length (bits)
- Time to send bits into link =  $L/R$

### 4. Propagation delay

- $d$  = length of physical link (distance)
- $s$  = propagation speed in medium ( $\sim 2 \times 10^8$  m/s)
- Propagation delay =  $d/s$

Note:  $s$  and  $R$  are **very** different quantities!

[Example](#)

## Caravan analogy

- cars “propagate” at 100 km/hr
- toll booth takes 12 sec to service car (transmission time)
- car ~ bit; caravan ~ packet
- Q: How long until caravan is lined up before 2nd toll booth?**
- Time to “push” entire caravan through toll booth onto highway =  $12 \cdot 10 = 120$  sec
- Time for last car to propagate from 1st to 2nd toll booth:  $100 \text{ km} / (100 \text{ km/hr}) = 1 \text{ hr}$
- A: 62 minutes**

Introduction

1-55

## Nodal delay

$$d_{\text{nodal}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

- $d_{\text{proc}}$  = processing delay
  - Typically a few microseconds or less
- $d_{\text{queue}}$  = queuing delay
  - depends on congestion
- $d_{\text{trans}}$  = transmission delay
  - =  $L/R$ , significant for low speed links
- $d_{\text{prop}}$  = propagation delay
  - A few microseconds to hundreds of milliseconds

Telem e eSaúde 11/12 - Intro Comm Nets - pbrandao

56

## Packet loss

- ❑ queue (buffer) preceding link in buffer has finite capacity
- ❑ packet arriving to full queue dropped (lost)
- ❑ lost packet may be retransmitted by previous node, by source end system, or not at all

## Throughput

- ❑ **Throughput:** rate (bits/time unit) at which bits transferred between sender/receiver
  - *instantaneous:* rate at given point in time
  - *average:* rate over longer period of time

## Throughput

- $R_s < R_c$  What is average end-end throughput?

- $R_s > R_c$  What is average end-end throughput?

**bottleneck link**  
link on end-end path that constrains end-end throughput

## Throughput: Internet scenario

- $Q$ : throughput per connection?

- $\min(R_c, R_s, R/10)$

- in practice:  $R_c$  or  $R_s$  is often bottleneck

10 connections (fairly) share backbone bottleneck link  $R$  bits/sec

## Summary

1.1 What is the Internet?

1.2 Network edge

- end systems, access networks, links

1.3 Network core

- circuit switching, packet switching, network structure

1.4 Delay, loss and throughput in packet-switched networks

1.5 Protocol layers, service models

## Protocol layers

□ Networks are complex!!!!

□ Many “pieces”:

- hosts
- routers
- Links of various types
- applications
- protocols
- hardware, software

## Sending “snail” mail

|                |             |                |                |   |
|----------------|-------------|----------------|----------------|---|
| Aviso Recepção |             | Aviso Recepção |                |  |
| Registo        |             | Registo        |                |  |
| Street, Number |             | Street, Number | Street, Number |  |
| Postal Code    | Postal Code | Postal Code    | Postal Code    |  |

Regional Dist.
Local Dist.

- ❑ Each layer uses the lower adding something:
  - Address “precision”
  - Extra services (reliability, receipt acknowledgement)

Telemed e eSaúde 11/12 - Intro Comm Nets - pbrandao

64

## Why layering?

Dealing with complex systems:

- ❑ explicit structure allows identification, relationship of complex system’s pieces
  - layered **reference model** for discussion
- ❑ modularization eases maintenance, updating of system
  - change of implementation of layer’s service transparent to rest of system
  - e.g., change in gate procedure doesn’t affect rest of system

Telemed e eSaúde 11/12 - Intro Comm Nets - pbrandao

65

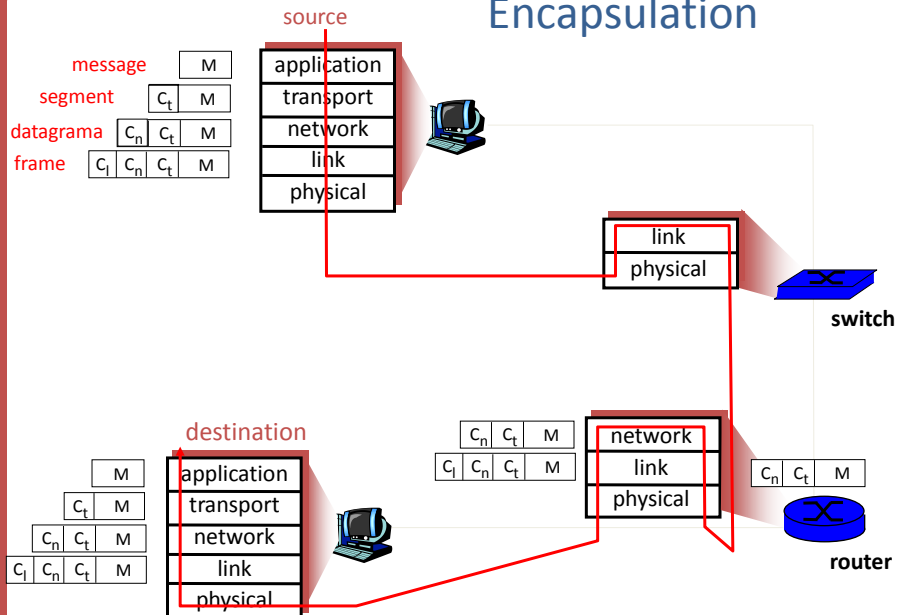

# Internet protocol stack

- ❑ **Application** : network applications
  - FTP, SMTP, HTTP
- ❑ **transport**: transferring data between processes
  - TCP, UDP
- ❑ **Network** : routing of datagrams between source and destination
  - IP, routing protocols
- ❑ **link**: data transfer between neighbouring network elements
  - PPP, Ethernet
- ❑ **Physical**: bits “on the wire”

# Encapsulation

# END INTRODUCTION TO COMMUNICATION NETWORKS

Telemed e eSaúde 11/12 - Intro Comm Nets -  
pbrandao
