Santa Clara County Public Health Department						
TB Risk Assessment for School Entry						
This form must be completed by a licensed health professional and returned to the child's school.						
1. Was your child born in Africa, Asia, Latin America, or Eas			ppe?	☐ Yes	□ No	
2. Has your child traveled to a country with a high TB rate* (for more the			than a week)?	Yes	□ No	
3. Has your child been exposed to anyone with tuberculosis (ease?	☐ Yes	□ No	
4. Has a family member or someone your child has been in cont with had a positive TB test or received medications for TB?				☐ Yes	□ No	
5. Was a parent, household member or someone your child has been in close contact with, born in or traveled to a country with a high TB rate?*				☐ Yes	□ No	
6. Has another risk factor for TB (i.e. one of those listed on the back of this page)?				☐ Yes	□ No	
* This includes countries in Africa, Asia, Latin America or Eastern Europe. For travel, the risk of TB exposure is higher if a child stayed with friends or family members for a cumulative total of 1 week or more.						
If YES, to any of the above, the child has an increased risk of TB infection and should have a TST/ IGRA.						
All children with a positive TST/IGRA result must have a medical evaluation, including a chest X-ray. Treatment for latent TB infection should be initiated if the chest X-ray is normal and there are no signs of active TB. If testing was done, please attach or enter results below.						
Tuberculin Skin Test (TS	Г/Mantoux/PPD)	Induratio	n mm			
Date given:	Date read:	Impressi	on: Negative	☐ Positive)	
Interferon Gamma Releas	se Assay (IGRA)					
Date:		Impressi	on: Negative	☐ Positive	e 🗆 Indeterminate	
Chest X-Ray (required w	ith positive TST or IGF	RA)				
Date:		Impressi	on: 🗖 Normal	☐ Abnorn	nal finding	
□ LTBI treatment (Rx &	start date):	☐ Prior	☐ Prior TB/LTBI treatment (Rx & duration):			
☐ Contraindications to I	NH or rifampin for LTBI	☐ Offe	red but refused L	TBI treatme	nt	
Providers, please check	one of the boxes belo	w and sign:				
☐ Child has no TB symp	otoms, none of the abov	e or other risk facto	rs for TB and do	es not requir	e a TB test.	
☐ Child has a risk factor, has been evaluated for TB and is free of active TB disease.

Risk Factors for Tuberculosis (TB) in Children

- Have clinical evidence or symptoms of TB
- Have a family member or contacts with history of confirmed or suspected TB
- Are in foreign-born families from TB endemic countries (including countries in Africa, Asia, Latin America or Eastern Europe)
- Travel to countries with high rate of TB
- Contact with individual(s) with a positive TB test
- Abnormalities on chest X-ray suggestive of TB
- Adopted from any high-risk area or live in out-of-home placements

- Live with an adult who has been incarcerated in the last five years
- Live among or frequently exposed to individuals who are homeless, migrant farm workers, residents of nursing homes, or users of street drugs
- Drink raw milk or eat unpasteurized cheese (i.e. queso fresco or unpasteurized cheese)
- Have, or are suspected to have, HIV infection or live with an adult with HIV seropositivity. See below for testing methods in children with HIV or other immunocompromised conditions.

Testing Methods

A Mantoux tuberculin skin test (TST) or an Interferon Gamma Release Assay (IGRA) (for children aged 4 and older) should be used to test those at increased risk. A TST of \geq 10mm is considered positive. If a child has had contact with someone with active TB (yes to question 3 on reverse) then TST \geq 5mm is considered positive.

Screening should be performed by CXR in addition to a TST/IGRA (consider doing both) and symptom review in HIV infected or suspected HIV, other immunocompromised conditions or if a child is taking immunosuppressive medications such as prednisone or TNF-alpha antagonists.

Referral, Treatment, and Follow-up of Children with Positive TB Tests

- All children with a positive TST or IGRA result should have a medical evaluation, including a chest X-ray.
- Report any confirmed or suspected case of TB disease to the TB Control Program within 1 day, including any child with an abnormal chest X-ray.
- If TB disease is not found, treat children and adolescents with a positive TST or IGRA for latent TB infection (LTBI).
- Isoniazid (INH) is the drug of choice for the treatment of LTBI in children and adolescents. The length of treatment is 9 months with daily dosing: 10-15mg/kg (maximum 300 mg).
- For management and treatment guidelines for TB or LTBI, go to: www.cdc.gov/tb or contact the TB Control Program at (408) 885-4214.
