

Respirometry for Environmental Science and Engineering

by **James C. Young** and **Robert M. Cowan**

Contents:

- **Fundamentals of respirometry**
Covers biological growth relationships and their application to respirometry.
- **Features of commercial respirometers**
Describes the basis for design and operation of commercial respirometers including discussions of their operating features.
- **Applications of respirometry**
Covers biodegradation testing, toxicity assessment, anaerobic and anoxic tests, and biomass activity.
- **Biodegradation Kinetics**
Describes protocols for kinetic analysis and shows how various kinetic parameters affect the modeling of microbiological reactions.
- **Respirometry for activated sludge process control**
OUR fingerprints, estimating active biomass concentrations, continuous monitoring using on-line respirometers, and Short-Term BOD.
- **Treatability testing**
Describes batch and continuous methods for assessing treatability of wastewaters.

Book Features: Soft cover; 210 pages; Library of Congress Control Number: 2004095184; ISBN 0-9759595-0-6; © 2004, SJ Enterprises, P.O. Box 1623, Springdale, Arkansas USA

About the Authors

James C. Young has 37 years experience in teaching, research and consulting on topics related to biological wastewater treatment. Much of his research work has involved development of design and operating parameters for wastewater treatment processes and using respirometry for wastewater analysis, diagnosing treatment plant operating problems, activated sludge process control, and assessing treatability of industrial wastewaters.

Robert M. Cowan has 13 years of academic, research and consulting experience in environmental engineering, focusing on biodegradation kinetics, bioremediation, and biological wastewater treatment. Dr. Cowan's work with respirometers has concentrated on methods for measuring kinetic parameters and evaluating factors affecting the application of these measurements to wastewater treatment plant environments.
